pRack pR300T

PRack pR300T user manual for the management of CO₂ systems in transcritical conditions

READ CAREFULLY IN THE TEXT!

IMPORTANT

CAREL bases the development of its products on decades of experience in HVAC, on the continuous investments in technological innovations to products, procedures and strict quality processes with in-circuit and functional testing on 100% of its products, and on the most innovative production technology available on the market. CAREL and its subsidiaries nonetheless cannot guarantee that all the aspects of the product and the software included with the product respond to the requirements of the final application, despite the product being developed according to start-of-the-art techniques. The customer (manufacturer, developer or installer of the final equipment) accepts all liability and risk relating to the configuration of the product in order to reach the expected results in relation to the specific final installation and/or equipment. CAREL may, based on specific agreements, act as a consultant for the positive commissioning of the final unit/application, however in no case does it accept liability for the correct operation of the final equipment/system.

The CAREL product is a state-of-the-art product, whose operation is specified in the technical documentation supplied with the product or can be downloaded, even prior to purchase, from the website www.CAREL.com. Each CAREL product, in relation to its advanced level of technology, requires setup / configuration / programming / commissioning to be able to operate in the best possible way for the specific application. The failure to complete such operations, which are required/indicated in the user manual, may cause the final product to malfunction; CAREL accepts no liability in such cases.

Only qualified personnel may install or carry out technical service on the product.

The customer must only use the product in the manner described in the documentation relating to the product.

In addition to observing any further warnings described in this manual, the following warnings must be heeded for all CAREL products:

- Prevent the electronic circuits from getting wet. Rain, humidity and all types of liquids or condensate
 contain corrosive minerals that may damage the electronic circuits. In any case, the product should be used
 or stored in environments that comply with the temperature and humidity limits specified in the manual.
- Do not install the device in particularly hot environments. Too high temperatures may reduce the life of
 electronic devices, damage them and deform or melt the plastic parts. In any case, the product should
 be used or stored in environments that comply with the temperature and humidity limits specified in the
 manual.
- Do not attempt to open the device in any way other than described in the manual.
- Do not drop, hit or shake the device, as the internal circuits and mechanisms may be irreparably damaged.
- Do not use corrosive chemicals, solvents or aggressive detergents to clean the device.
- Do not use the product for applications other than those specified in the technical manual.

All of the above suggestions likewise apply to the controllers, serial boards, programming keys or any other accessory in the CAREL product portfolio.

CAREL adopts a policy of continual development. Consequently, CAREL reserves the right to make changes and improvements to any product described in this document without prior warning.

The technical specifications shown in the manual may be changed without prior warning.

The liability of CAREL in relation to its products is specified in the CAREL general contract conditions, available on the website www.CAREL.com and/or by specific agreements with customers; specifically, to the extent where allowed by applicable legislation, in no case will CAREL, its employees or subsidiaries be liable for any lost earnings or sales, losses of data and information, costs of replacement goods or services, damage to things or people, downtime or any direct, indirect, incidental, actual, punitive, exemplary, special or consequential damage of any kind whatsoever, whether contractual, extra-contractual or due to negligence, or any other liabilities deriving from the installation, use or impossibility to use the product, even if CAREL or its subsidiaries are warned of the possibility of such damage.

DISPOSAL

INFORMATION FOR USERS ON THE CORRECT HANDLING OF WASTE ELECTRICAL AND ELECTRONIC EQUIPMENT (WEEE)

In reference to European Union directive 2002/96/EC issued on 27 January 2003 and the related national legislation, please note that:

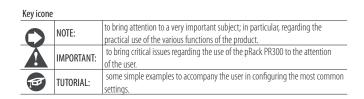

- WEEE cannot be disposed of as municipal waste and such waste must be collected and disposed of separately;
- the public or private waste collection systems defined by local legislation must be used. In addition, the
 equipment can be returned to the distributor at the end of its working life when buying new equipment;
- the equipment may contain hazardous substances: the improper use or incorrect disposal of such may have negative effects on human health and on the environment;
- the symbol (crossed-out wheeled bin) shown on the product or on the packaging and on the instruction sheet indicates that the equipment has been introduced onto the market after 13 August 2005 and that it must be disposed of separately;
- in the event of illegal disposal of electrical and electronic waste, the penalties are specified by local waste disposal legislation.

Warranty on the materials: 2 years (from the date of production, excluding consumables).

Approval: the quality and safety of CAREL INDUSTRIES Hqs products are guaranteed by the ISO 9001 certified design and production system.

separate as much as possible the probe and digital input signal cables from the cables carrying inductive loads and power cables to avoid possible electromagnetic disturbance. Never run power cables (including the electrical panel wiring) and signal cables in the same conduits.

CAREL reserves the right to modify the features of its products without prior notice.

1. INTRODUCTION

1.1 Main features

pRack pR300T is the integrated CAREL solution for control and management of $\rm CO_2$ compressor racks.

The main features and compressor management characteristics of pRack pR300T are listed below.

1.1.1 pR300T functionality list

	· · · · · · · · · · · · · · · · · · ·
	Possibility of management integrated in a single control for
	the medium temperature and low temperature line and the
	high pressure stage.
	Management of the high pressure valve (HPV)
	Management of the receiver pressure regulating valve
	(RPRV)
	Valves management via external or built-in (PRK30TD*)
	driver through fieldbus communication port or via external
	driver in position mode in 010V
	Integration between HPV and receiver pressure Accessory functions (pre-positioning, minimum and
Main features	
mainreatures	maximum values differentiated by machine ON and OFF,
	maximum distance from the setpoint,)
	Oil cooler
	Oil receiver and oil injection Heat Reclaim
	Integration between heat reclaim and HPV and RPRV valve
	5
	Double suction line and one high pressure stage
	Up to 16 fans for condensing line
	Inverter regulation on the first compressor and on the first fan
	Generic functions easily configurable (ON/OFF, modulations,
	alarms, scheduler)
	S, M, D, L version (based on pCO5+ hardware)
Hardware	External display (pGDE) or built-in display
	Scroll, reciprocating, digital scroll compressors management
	Up to 12 piston compressors per line, a maximum of 4
	different sizes
	Up to 4 alarms per compressor
Compressors	Inverter management, even with modulation inside the
	dead zone
	Pump down
	Control of overheating in suction
Lingue	Control of overheating in suction Italian, English, German, French, Spanish, Russian,
Lingue	Control of overheating in suction Italian, English, German, French, Spanish, Russian, Portoguese, Swedish

1.2 Components and accessories

The pRack pR300T is available in 4 hardware sizes listed in the table (for the detailed description of each size, electrical characteristics and installation, refer to Chapter 2):

Hardware sizes:

Size	Available analog inputs	Available digital inputs	Available analog outputs	Available digital outputs
Small	5 (*)	8	4	8
Medium	8 (*)	14	4	13
Medium + Driver	8(*) + 4	14+2	4	13
Large	10 (*)	18	6	18
				Tab. 1.b

(*) can also be used as digital inputs

For each size the following versions are available: • with built-in terminal, without terminal

- All pRack pR300T models are equipped with:
- integrated RS485 serial interface
- anthracite gray plastic cover
- connector kit
- USB.

Tab. 1.d

1.3 Configuration of the system and configuration of the inputs and outputs

pRack pR300T has the same system configuration management and input and output configuration management as the standard pRack.

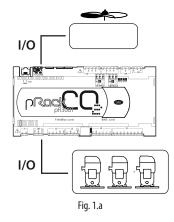

Note: each input/output is completely configurable with the only requirements being those set by the system configuration. For example, the suction pressure probe on line 1 can be arbitrarily configured to any one of the analog inputs in the pLAN control board with address 1 compatible with the type of probe.

1.3.1 System configurations available

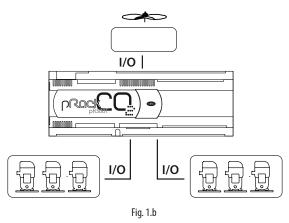

pRack pR300T can manage system configurations with up to 2 suction lines (maximum 12 scroll or piston compressors for lines 1 and 2) and up to 1 high pressure line (maximum 16 fans per line). When there are two suction lines, the lines can be managed by the same pRack board or by separate boards. The condenser line can be managed by the board that manages the suction line, or by a separate board, in accordance with the number of inputs/outputs available.

For each line, both suction and condensing, pRack pR300T can manage a modulating device (inverter, Digital Scroll® compressor or compressor with continuous control).

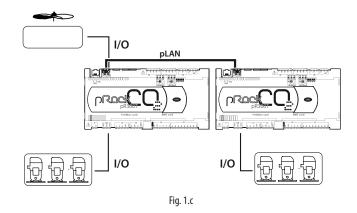

Example 1: 1 suction line with scroll or piston compressors, 1 high pressure line:

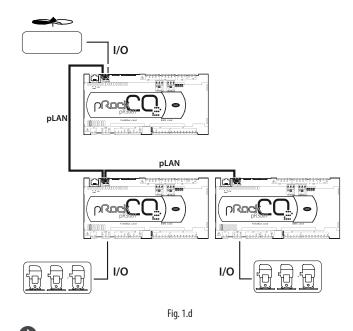

Example 2: 2 suction lines on the same board with scroll or piston compressors, 1 high pressure line:

Example 3: 2 suction lines on separate boards (scroll or piston compressors), 1 high pressure line (on the first suction line board):

Example 4: 2 suction lines on separate boards with scroll or piston compressors, 1 high pressure line on separate board:

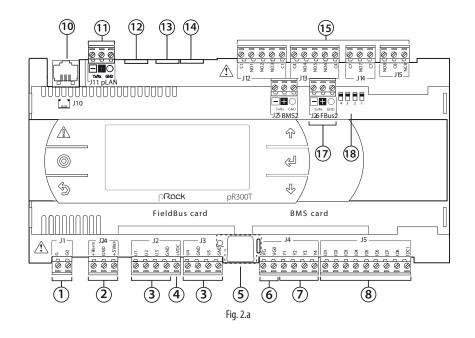

Note: if connecting more than one pRack pR300 board in a pLAN, mixed networks cannot be created combining Compact boards and S, M, L boards, while mixed networks are possible using combinations of the latter models only.

Important: all the boards connected to the pLAN must have the same software revision.

Tab. 2.e

2.2.3 Universal inputs/outputs U...

Analogue inputs, Lmax = 30 m		SMALL	MEDIUM/ BUILT-IN DRIVER	LARGE
(maximum number)	- CAREL NTC probes (-50T90°C; R/T 10 kΩ±1% at 25°C); - HT NTC (0T150°C); - PTC (600Ω to 2200Ω)	5	8	10
	- PT500 (-100T400°C) - PT1000 (-100T400°C) - PT100 probes (-100T200°C)	2	3 (2 on U1U5, 1 on U6U8)	4 (2 on U1U5,
	- 0 to 1 Vdc/0 to 10 Vdc signals from probes powered by controller	در بر 1	m 6	1 on U6U8, 1 on U9U10) 0 6
	- 0 to 1 Vdc/0 to 10 Vdc signals powered externally	max tot	max tot 8	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0
	- 0 to 20 mA /4 to 20 mA inputs from probes powered by the controller	ot 4 4	6 (max 4 on U1U5, ▷ 3 on U6U8)	6 (max 4 on U1U5, 3 on U6U8, 5 2 on U8. U10)
	- 0 to 20 mA /4 to 20 mA inputs powered externally	×4	7 (max 4 on U1U5, 3 on U6U8)	A 9 (max 4 on U1U5, 3 on U6U8, 2 on U9U10)
	- 0 to 5 V signals from ratiometric probes powered by controller	5	6	6
	Input precision: ± 0.3 % f.s.			
	Time constant for each input: 0.5 s			
	Classification of measuring circuits (CEI EN 61010-1): category I	CAAALI		
Digital inputs w/o optical isolation,		SMALL	MEDIUM/ BUILT-IN	LARGE
Lmax = 30 m	- voltage-free contacts	5	DRIVER	10
(maximum number)	- fast digital inputs	max 2	0	6
	type: voltage-free contact		(max 2 on U1U5,	(max 2 on U1U5,
	max current: 10 mA		max 2 on U6U8)	max 2 on U6U8.
	max frequency 2kHz and resolution ± 1 Hz		(110000)	2 on U9U10)

Important:

for active probes powered externally (0 to 1 V, 0 to 10 V, 0 to 20 mA, 4 to 20 mA), to avoid irreparably damaging the controller, implement adequate current
protection measures that must ensure < 100 mA;

• the ratiometric probes can only be powered by the controller;

• on power-up, the universal inputs/outputs remain shorted to GND for around 500 ms until the end of the configuration procedure.

Analogue outputs w/o optical		SMALL	MEDIUM/ BUILT-IN	LARGE
isolation (maximum number),			DRIVER	
Lmax = 30 m	0 to 10 Vdc (maximum current 2 mA)	5	8	10
	PWM (output 0/3.3 Vdc, maximum current 2 mA, frequency:	5	8	10
	2kHz asynchronous)			

Tab. 2.f

2.2.4 Power supply to probes and terminals

+Vdc	can be used to power any active probes using the 24/21 Vdc ± 10% (P+5*/P+3*) available at terminal +VDC (J2). The maximum current available is 150 mA, protected against short-circuits.
+5Vref	to power the 0 to 5V ratiometric probes, use the 5 Vdc (± 5%) available at terminal +5VREF(J24). The maximum current available is 60 mA.
\/torpo	P+3******:21 Vdc ± 10%; P+5*******:24 Vdc ± 10%
Vterm	Used to power an external terminal as an alternative to the one connected to J10, Pmax = 1.5 W
Important: if the le	noth exceeds 10 m. use shielded cable with the shield connected to earth. In any case, the max length allowed is 30 m.

Tab. 2.g

2.2.5 Digital inputs ID... IDH...

Type	Optically-isolated		
Lmax	30 m		
		no. of optically-isolated	no. of optically-isolated inputs, 24 Vac/Vdc or 230 Vac -
		inputs, 24 Vac or 24 Vdc	50/60 Hz

detection time	Normally closed (closed-open-closed)	400 ms	
Power supply to the inputs	External	IDH: 230 Vac (+10/-15%	6) 50/60 Hz
	Category I: 24 Vac/Vdc (J5, J7, J20) Category III: 230 Vac (J8, J19)		
Digital input current draw at	24 Vac/Vdc	5 mA	
Digital input current draw at	230 Vac	5 mA	
			Tab

• separate as much as possible the probe and digital input cables from cables to inductive loads and power cables, so as to avoid possible electromagnetic disturbance. Never run power cables (including the electrical panel cables) and signal cables in the same conduits;

the two 230 Vac or 24 Vac/Vdc inputs on terminals J8 (ID13, ID14) or J19 (ID15, ID16) have the same common pole and therefore both will operate at 230 Vac or 24 Vac/Vdc. There is basic insulation between the two inputs; there is reinforced insulation between the inputs and the rest of the controller;
ID1...ID8, ID9 to ID12, ID17, ID18 have functional insulation from the rest of the controller;

• for DC voltage inputs (24 Vdc) either the + or the - can be connected to common terminal;

the rating of the external contact connected to the digital inputs must be at least 5 mA.

2.2.6 Analogue outputs Y...

Туре	0 to 10 V optically-isolated on Y1Y6

Precision	Y1Y6	± 2% full scale
Resolution	8 bit	
Settling time	Y1Y6	from 1 s (slew rate 10 V/s) to 20 s (slew rate 0.5 V/s) selectable via SW
Maximum load	1 kΩ (10 mA)	
		T 2

Tab. 2.i

Warnings:

- for lengths > 10 m, only use shielded cable, with the shield connected to earth;
- a 0 to 10 Vdc analogue output can be connected in parallel to other outputs of the same type, or alternatively to an external source of voltage. The higher voltage will be considered. Correct operation is not guaranteed if actuators with voltage inputs are connected;
- power the VG-VG0 analogue outputs at the same voltage on G-G0: Connect G0 to VG0 and G to VG. This is valid for both alternating and direct current power supplies.

2.2.7 Digital outputs NO..., NC...

2.2.8 SSR outputs (in models where featured)

	2: SMALL (outputs 7, 8); 2: MEDIUM (outputs 7, 12); 6: LARGE (outputs 7, 8, 12, 13, 14, 15)
Working voltage	24 Vac/Vdc
Load current (MAX)	1 A
Impulsive load current (MAX)	1.2 A

Tab. 2.k

Warnings:

- if the load requires higher current, use an external SSR;
- to power external loads, use the same power supply as the pCO (connected to terminals G/G0); this must always be dedicated and not in common with the power supply to other devices on the electrical panel (such as contactors, coils, etc...);
- the groups that the digital outputs are divided into have two common pole terminals to simplify wiring;
- make sure that the current running through the common terminals does not exceed the rated current of an individual terminal, that is, 8 A.

Use AWG 20-22 twisted pair shielded cable for the +/-

Serial	Type/connectors	Features

		J23 and J26 are independent.
		Tat

Note: in industrial/residential environments, for distances > 10 m, shielded cable is required, with the shield connected to earth. In residential environments (EN 55014), irrespective of the cable length, on versions without valve driver, the connection cable between the controller and the terminal and the serial cable must be shielded and connected to earth at both ends.

		high temperature NTC	10 kΩ at 25 °C,-40T150 °C	measurement error: 1.5 °C in the range -20T115 °C; 4 °C in range					
				outside of -20T115 ℃					
		combined NTC	10 kΩ at 25 °C, -40T120 °C	measurement error 1 °C in the range -40T50 °C; 3°C in the range					
				+50T90 ℃					
Power to active			· · · · · ·						
probes (VREF)	pro	ogrammable output: +5 Vdc \pm 2% or 12 Vdc \pm	±10%, Imax = 50 mA						
probes (VILEI)	ont	tional Elltracapacitor module (PCOS00LIC20	or EVD0000LIC0). If the cor	ntroller operates constantly at temperatures near the upper limit of					
Emergency power				possible located in the coolest point of the panel. The PCOS00UC20					
J / 1									
supply	and EVD0000UC0 modules can be connected at the same time to the same controller, thus doubling the energy available to close the valves.								
	Imp	Important: The module only powers the valve driver and not the controller.

2.2.11 Meaning of the inputs/outputs on the pRack pR300T S, M, L boards

Version	Connector	Signal	Description
	J1-1	G	+24 Vdc or 24 Vac power supply
	J1-2	G0	power supply reference
	J2-1	B1	universal analogue input 1 (NTC, 0 to 1 V, 0 to 5 V ratiometric, 010 V, 020 mA, 420 mA)
	J2-2	B2	universal analogue input 2 (NTC, 0 to 1 V, 0 to 5 V ratiometric, 0, 10 V, 0, 20 mA, 4, 20 mA)
	J2-3	B3	universal analogue input 3 (NTC, 0 to 1 V, 0 to 5 V ratiometric, 010 V, 020 mA, 420 mA)
	J2-4	GND	common for analogue inputs
	J2-5	+VDC	21 Vdc power supply for active probes (maximum current 200 mA)
	J3-1	B4	passive analogue input 4 (NTC, PT1000, ON/OFF)
	J3-2	BC4	common for analogue input 4
	J3-3	B5	passive analogue input 5 (NTC, PT1000, ON/OFF)
	J3-4	BC5	common for analogue input 5
	J4-1	VG	power to optically-isolated analogue output, 24 Vac/Vdc
S, M, L	J4-2	VG0	power to optically-isolated analogue output, 0 Vac/Vdc
J, IVI, ∟	J4-3	Y1	analogue output no. 1, 010 V
	J4-4	Y2	analogue output no. 2, 010 V
	J4-5	Y3	analogue output no. 3, 010 V
	J4-6	Y4	analogue output no.4,010 V
	J5-1	ID1	digital input no. 1, 24 Vac/Vdc
	J5-2	ID2	digital input no. 2, 24 Vac/Vdc
	J5-3	ID3	digital input no. 3, 24 Vac/Vdc
	J5-4	ID4	digital input no. 4, 24 Vac/Vdc
	J5-5	ID5	digital input no. 5, 24 Vac/Vdc
	J5-6	ID6	digital input no. 6, 24 Vac/Vdc
	J5-7	ID7	digital input no. 7, 24 Vac/Vdc
	J5-8 J5-9	ID8 IDC1	digital input no. 8, 24 Vac/Vdc common for digital inputs from 1 to 8 (negative pole for DC power supply)
	J5-9 J6-1	B6	universal analogue inputs from 1 to 8 (negative pole for DC power supply) universal analogue input 6 (NTC, 0 to 1 V, 0 to 5 V ratiometric, 010 V, 020 mA, 420 mA)
	J6-2	B6 B7	universal analogue input 6 (NTC, 0 to 1 V, 0 to 5 V ratiometric, 010 V, 020 mA, 420 mA) Juniversal analogue input 7 (NTC, 0 to 1 V, 0 to 5 V ratiometric, 010 V, 020 mA, 420 mA)
	J6-3	B8	universal analogue input 7 (NTC, 0 to 1 V, 0 to 5 V ratiometric, 010 V, 020 mA, 420 mA) Juniversal analogue input 8 (NTC, 0 to 1 V, 0 to 5 V ratiometric, 010 V, 020 mA, 420 mA)
	J6-4	GND	common for analogue inputs
	J0-4 J7-1	ID9	digital input no. 9, 24 Vac/Vdc
	J7-2	ID10	digital input no. 0, 24 Vac/Vdc
	J7-3	ID10	digital input no. 11, 24 Vac/Vdc
M, L	17-4	ID12	digital input no. 17, 24 VaC/Vdc
	J7-5	IDC9	common for digital inputs from 9 to 12 (negative pole for DC power supply)
	J8-1	ID13H	digital input no. 13, 230 Vac
	J8-2	ID13	digital input no. 13, 24 Vac/Vdc
	J8-3	IDC13	common for digital inputs 13 and 14 (negative pole for DC power supply)
	J8-4	ID14	digital input no. 14, 24 Vac/Vdc
	J8-5	ID14H	digital input to. 1, 21 Vac Vac
	19		8-pin telephone connector for connecting a display terminal (not used)
	J10		6-pin telephone connector for connecting the standard pGDE user terminal
	J11-1	RX-/TX-	RX-/TX- connector for RS485 connection to the pLAN network
	J11-2	RX+/TX+	RX+/TX+ connector for RS485 connection to the pLAN network
	J11-3	GND	GND connector for RS485 connection to the pLAN network
	J12-1	C1	common for relays: 1, 2, 3
	J12-2	NO1	normally open contact, relay no. 1
	J12-3	NO2	normally open contact, relay no. 2
	J12-4	NO3	normally open contact, relay no. 3
	J12-5	C1	common for relays: 1, 2, 3
S, M, L	J13-1	C4	common for relays: 4, 5, 6
	J13-2	NO4	normally open contact, relay no. 4
	J13-3	NO5	normally open contact, relay no. 5
	J13-4	NO6	normally open contact, relay no. 6
	J13-5	C4	common for relays: 4, 5, 6
	J14-1	C7	common for relay no. 7 normally open contact, relay no. 7/ normally open contact, relay no. 7 SSR 24 Vac/Vdc (*)
	J14-2	NO7	uormauv open contact, relavino, 77 normaliv open contact, relavino, 7 NK 24 Vac/Vdc (*)
		C7	
	J14-3	C7	common for relay no. 7
	J15-1	NO8	common for relay no. 7 normally open contact, relay no. 8/ only S-board: normally open contact, relay no. 8 SSR 24 Vac/Vdc, S board only (*)
	J15-1 J15-2	NO8 C8	common for relay no. 7 normally open contact, relay no. 8/ only S-board: normally open contact, relay no. 8 SSR 24 Vac/Vdc, S board only (*) common for relay no. 8
	J15-1 J15-2 J15-3	NO8 C8 NC8/	common for relay no. 7 normally open contact, relay no. 8/ only S-board: normally open contact, relay no. 8 SSR 24 Vac/Vdc, S board only (*) common for relay no. 8 normally closed contact relay no. 8/ only S-board: not used, S board only (*)
	J15-1 J15-2 J15-3 J16-1	NO8 C8 NC8/ C9	common for relay no. 7 normally open contact, relay no. 8/ only S-board: normally open contact, relay no. 8 SSR 24 Vac/Vdc, S board only (*) common for relay no. 8 normally closed contact relay no. 8/ only S-board: not used, S board only (*) common for relay: 9, 10, 11
	J15-1 J15-2 J15-3 J16-1 J16-2	NO8 C8 NC8/ C9 NO9	common for relay no. 7 normally open contact, relay no. 8/ only S-board: normally open contact, relay no. 8 SSR 24 Vac/Vdc, S board only (*) common for relay no. 8 normally closed contact relay no. 8/ only S-board: not used, S board only (*) common for relay: 9, 10, 11 normally open contact, relay no. 9
	J15-1 J15-2 J15-3 J16-1 J16-2 J16-3	NO8 C8 NC8/ C9 NO9 NO10	common for relay no. 7 normally open contact, relay no. 8/ only S-board: normally open contact, relay no. 8 SSR 24 Vac/Vdc, S board only (*) common for relay no. 8 normally closed contact relay no. 8/ only S-board: not used, S board only (*) common for relay: 9, 10, 11 normally open contact, relay no. 9 normally open contact, relay no. 10
	J15-1 J15-2 J15-3 J16-1 J16-2 J16-3 J16-4	NO8 C8 NC8/ C9 NO9 NO10 NO11	common for relay no. 7 normally open contact, relay no. 8/ only S-board: normally open contact, relay no. 8 SSR 24 Vac/Vdc, S board only (*) common for relay no. 8 normally closed contact relay no. 8/ only S-board: not used, S board only (*) common for relay: 9, 10, 11 normally open contact, relay no. 9 normally open contact, relay no. 10 normally open contact, relay no. 11

2.5 Expansion card

From version 3.3.0, an I/O expansion card can be used to provide additional analogue and digital channels, ideal when there is a high number of compressors and corresponding alarms, or with complex heat recovery systems that require of numerous temperature sensors in the water and CO2 circuits (see technical leaflet +0500059IE for the product's electrical and physical specifications). The universal inputs/outputs (marked U on the connection diagram) can be configured by pRack pR300T to connect active and passive probes, digital inputs, analogue and PWM outputs, up to a total of 10. A further 6 digital outputs are also available.

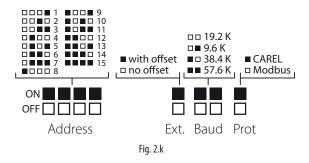

Key:

1	Power connector [G(+), G0(-), Vbat]
2	Universal inputs/outputs
3	+Vdc power supply for active probes
4	+5V power supply for ratiometric probes
5	Relay digital outputs
6	BMŚ connector
7	Communication indicator LED
8	Configuration indicator LED
	Configuration dipswitches

For correct communication with pRack pR300T, the dipswitches on the expansion card should be configured as follows:

- Address: 15
- Ext: no off set •
- Baud: 19.2 K •
- Prot: CAREL

The pRack pR300T software (version 3.3.0 and higher) offers the possibility to extend the number of I/Os by expansion card directly from the Wizard, in screen lb1f:

Additional configuration of the expansion card is possible on Fda01, under PROGRAMMING \rightarrow F.Settings \rightarrow d.FIELDBUS:

L1-Fieldbus	Fda01
Enable cpC0e:	NO
Offline pattern Digital output 1: OFF 2: OFF 4: OFF 5: OFF	pattern

When enabling "Offline pattern", the status of the outputs can be configured if the card is offline from the pRack.

Both the digital (Fda01) that analogue outputs (Fda02) can be configured

<u>L1-Fieldbu</u>	<u>S</u>	Fda02

UI 01:0% UI 03:0% UI 05:0% UI 07:0% UI 09:0%	UI 02: UI 04: UI 06: UI 08: UI 08: UI 10:	0% 0% 0%

Note: the expansion card cannot be used to configure the suction pressure probes (including the backup probes)

The expansion card is connected to the pRack pR300T via port J26 FBus on the pRack, the same used for connecting an external driver, and port J6BMS on the expansion card via RS485

Fig. 2.I

Only one expansion card can be used for each compressor rack and the expansion card can only be connected to the board with pLAN address 1:

Fig. 2.m

3.1 General installation instructions

3.1.1 Installation procedure

Environmental conditions

Avoid assembling the pRack PR300T and the terminal in environments with the following characteristics:

- temperature and humidity that do not conform to the rated operating data of the product;
- strong vibrations or knocks;
- exposure to aggressive and polluting atmospheres(e.g.: sulphur and ammonia fumes, saline mist, smoke) so as to avoid corrosion and/or oxidation;
- strong magnetic and/or radio frequency interference (therefore avoid installing the units near transmitting antennae);
- exposure of the pRack PR300T to direct sunlight and to the elements in general;
- large and rapid fluctuations in the room temperature;
- environments containing explosives or mixes of flammable gases;
- exposure to dust (formation of corrosive patina with possible oxidation and reduction of insulation).

Positioning the instrument inside the panel

The position of the instrument in the electrical cabinet must be chosen so as to guarantee correct physical separation of the instrument from the power components (solenoids, contactors, actuators, inverters, ...) and the connected cables. Proximity to such devices/cables may create random malfunctions that are not immediately evident.

The structure of the panel must allow the correct flow of cooling air.

3.1.2 Wiring procedure

When laying the wiring, "physically " separate the power part from the control part. The proximity of these two sets of wires will, in most cases, cause problems of induced disturbance or, over time, malfunctions or damage to the components. The ideal solution is to house these two circuits in two separate cabinets. Sometimes this is not possible, and therefore the power part and the control part must be installed inside the same panel. For the control Signals, it is recommended to use shielded cables with twisted wires.

If the control cables have to cross over the power cables, the intersections must be as near as possible to 90 degrees, always avoiding running the control cables parallel to the power cables.

- Use cable ends suitable for the corresponding terminals. Loosen each screw and insert the cable ends, then tighten the screws. When the operation is completed, slightly tug the cables to check they are sufficiently tight;
- separate as much as possible the sensor Signal, digital input and serial line cables from the cables carrying inductive loads and power cables to avoid possible electromagnetic disturbance. Never insert power cables (including the electrical cables) and probe Signal cables in the same conduits. Do not install the sensor cables in the immediate vicinity of power devices (contactors, circuit breakers or similar);
- reduce the path of the sensor cables as much as possible, and avoid spiral paths that enclose power devices;
- avoid touching or nearly touching the electronic components fitted on the boards to avoid electrostatic discharges (extremely damaging) from the operator to the components;
- if the power transformer secondary is earthed, check that the earth wire corresponds to the wire that runs to the controller and enters terminal G0; this applies to all the devices connected to the pRack PR300T;
- do not secure the cables to the terminals by pressing the screwdriver with excessive force, to avoid damaging the pRack PR300T;
- for applications subject to considerable vibrations (1.5 mm pk-pk 10/55 Hz), secure the cables connected to the pRack PR300 around 3 cm from the connectors using clamps;
- if the product is installed in industrial environments (application of the EN 61000-6-2 standard) the length of the connections must be less than 30 m;

- all the very low voltage connections (analogue and 24 Vac/Vdc digital inputs, analogue outputs, serial bus connections, power supplies) must have reinforced or double insulation from the mains network;
- in residential environments, the connection cable between the pRack PR300T and the terminal must be shielded;
- there is no limit to the number of cables that can be connected to an individual terminal. The only limitation concerns the maximum current crossing each terminal: this must not exceed 8 A;
- the maximum cross-section of the cable that connected to a terminal is 2.5 $\rm mm^2$ (12 AWG);
- the maximum value of the twisting torque to tighten the screw on the terminal (torque tightening) is 0.6 Nm;

Important:

- Installation must be performed according to the standards and legislation in force in the country where the device is used;
- for safety reasons the equipment must be housed inside an electrical panel, so that the only accessible part is the display and the keypad;
- in the event of malfunctions, do not attempt to repair the device, but rather contact the CAREL service centre;
- the connector kit also contains the stick-on labels.

3.1.3 Anchoring the pRack PR300T

The pRack PR300T is installed on a DIN rail. To fasten the unit to the DIN rail, press it lightly against the rail. The rear tabs will click into place, locking the unit to the rail. Removing the unit is just as Simple, using a screwdriver through the release slot to lever and lift the tabs. The tabs are kept in the locked position by springs.

3.2 Power supply

Power supply to	2836 Vdc +10/-20% or24 Vac +10/-15% 5060 Hz;
the pRack PR300T	
S, M, D, L (controller	Maximum current P= 15 W (power supply Vdc)
with terminal	P=40 VA (Vac)
connected)	

Tab. 3.a

Important:

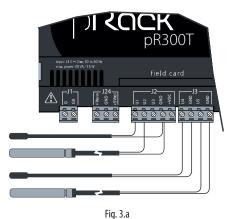

- power supplies other than those specified seriously damage the system;
- a Class II safety transformer, must be used in the installation to supply just one pRack PR300T controller, rating 30 VA for pRack Compact and 50 VA for pRack S, M, L;
- the power supply to the pRack PR300T controller and terminal (or pRack PR300T controllers and terminals) should be separated from the power supply to the other electrical devices (contactors and other electromechanical components) inside the electrical panel;
- if the power transformer secondary is earthed, check that the earth wire corresponds to the wire that runs to the controller and enters terminal G0. This applies to all the devices connected to the pRack PR300T;
- a yellow LED indicates that power is connected to the pRack PR300T.

3.3 Connecting the analogue inputs

The analogue inputs on the pRack PR300T can be configured for the most common sensors on the market: 0 to 1 V, 0...10 V, 0...20 mA, 4...20 mA. The different types of sensors for each input can be selected by setting a parameter on the user terminal.

3.3.1 Connecting universal NTC temperature sensors

The analogue inputs are compatible with 2-wire NTC sensors. The inputs must be set for NTC Signals from the user terminal or using the default value installation procedure. The connection diagram is shown below:

Hardware Version	Terminals	NTC probe cable
C	GND, U4, U5	1
2	U1, U2, U3, U4, U5	2
	GND, U4, U5	1
M, D	U1, U2, U3, U4, U5, U6, U7, U8, S2, S4	2
1	GND, U4, U5, U9, U10	1
L	U1, U2, U3, U4, U5, U6, U7, U8, U9, U10	2
		Tab. 3.b

Note: the two wires of the NTC sensors are equivalent, as they have no polarity, therefore it is not necessary to follow any specific order when connecting to the terminal block.

3.3.2 Connecting PT1000 temperature sensors

The pRack PR300T can be connected to 2-wire PT1000 sensors for all high temperature applications; the operating range is: -100 to 200 °C. The inputs must be pre-configured for PT1000 Signals from the user terminal or using the default value installation procedure. The connection diagram is shown below:

Fig. 3.b

Hardware Version	Terminals	PT1000 probe cable
C M	U4, U5, GND	1
S, M	U4, U5	2
	U4, U5, U9, U10	1
L	U4, U5, U9, U10	2
		Tab. 3.c

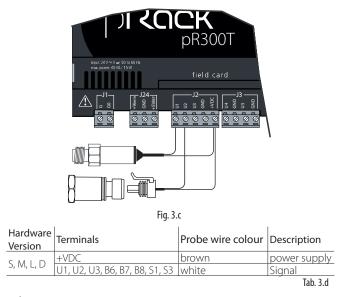

Important: for correct measurement by the PT1000 sensor, each sensor wire needs to be connected to a dedicated terminal, as shown in Fig. 3.b.

Note: the two wires of the PT1000 sensors are equivalent, as they have no polarity, therefore it is not necessary to follow any specific order when connecting to the terminal block.

3.3.3 Connecting current pressure probes

pRack PR300T can be connected to all CAREL SPK* series active pressure probes or any other pressure sensors available on the market with 0...20 mA or 4...20 mA Signal.

The inputs must be set for 0...20 mA or 4...20 mA Signals from the user terminal or using the default value installation procedure. The connection diagram is shown below:

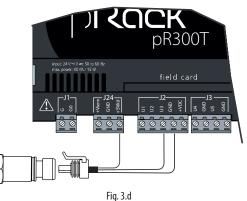

Important: do not connect the green wire.

3.3.4 Connecting 0 to 5 V ratiometric pressure probes

pRack PR300T can be connected to any other pressure probes available on the market with 0 to 5 V ratiometric sensor.

The inputs must be set for 0 to 5 V Signals from the user terminal or using the default value installation procedure.

The connection diagram is shown below:

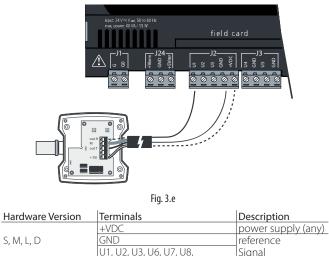

Hardware Probe wire Terminals Description Version colour +5 Vref black power supply power supply GND S, M, L, D green reference U1, U2, U3, U6, U7, U8, S1, S3 white Signal

Tab. 3.e

3.3.5 Connecting 0...10 V active probes

PRack PR300T can be connected to 0...10 V sensors. The inputs must be set for 0...10 V Signals from the user terminal or using the default value installation procedure. The connection diagram is shown below:

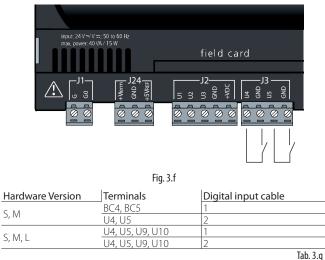

Tab. 3.f

Connecting the analogue inputs selected as 3.3.6 **ON/OFF**

The pRack PR300T allows some analogue inputs to be configured as voltage-free digital inputs, not optically-isolated.

The inputs must be pre-configured as voltage-free digital inputs from the user terminal or using the default value installation procedure.

Important: the maximum current available at the digital input is 5 mA (thus the rating of the external contact must be at least 5 mA). These inputs are not optically-isolated.

Remote connection of the analogue inputs 3.3.7

The Sizes of the cables for the remote connection of the analogue inputs are shown in the following table:

Tunc of input	Size [mm ²] for	Size [mm ²] for
Type of input	length up to 50 m	length up to 100 m
NTC	0.5	1.0
PT1000	0.75	1.5
current	0.25	0.5
voltage	0.25	0.5
		Tab. 3.h

If the product is installed in industrial enviroment (in compliance for the EN 61000-6-2 standard) the length of the connections must be less than 30m. In any case you should never exceed this length to have no measurement errors.

3.4 Connecting the digital inputs

The pRack PR300T features digital inputs for connecting safety devices, alarms, device status and remote switches. These inputs are all optically isolated from the other terminals. They can work at 24 Vac, 24 Vdc and some at 230 Vac for S, M, L models.

Note: separate the sensor Signal and digital input cables as much as possible from the inductive load and power cables, to avoid possible electromagnetic disturbance.

Important:

- if the control voltage is drawn in parallel with a coil, fit a dedicated RC filter in parallel with the coil (the typical ratings are 100Ω , 0.5 µF, 630 V).
- If connecting the digital inputs to safety systems (alarms), remember that: the presence of voltage across the contact must be the normal operating condition, while no voltage must represent an alarm situation. This will ensure that any interruption (or disconnection) of the input will also be Signalled. Do not connect the neutral in place of an open digital input. Always interrupt the phase. The 24 Vac/Vdc digital inputs have a Resistance of around 5 k Ω .

All pRack digital inputs can be powered at 24 Vac and 24 Vdc, while for models M, L only 230 Vac inouts are also available.

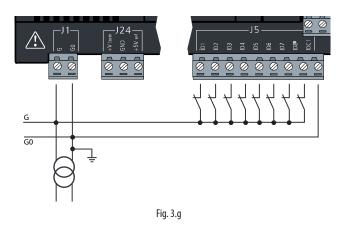

To maintain the optical isolation of the digital inputs, a separate power supply must be used just for the digital inputs.

The connection diagrams shown in these figures, which while being the more common and the more convenient, do not exclude the possibility of powering the digital inputs independently from the power supply to the pRack PR300T.

In any case, the inputs only have functional insulation from the rest of the controller.

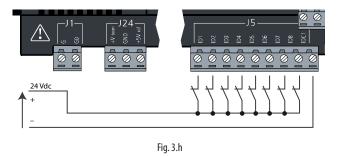

24 Vac digital inputs

The following figure represents an example for connecting the 24 Vac digital inputs on pRack models S, M, L.

24 Vdc digital inputs

The following figure represents an example for connecting the 24 Vdc digital inputs on pRack models S, M, L.

230 Vac digital inputs

pRack M, L models have up to two groups of inputs powered at 230 Vac 50/60 Hz +10/-15%; each group features two inputs (see paragraph 2.2.1 for details). The groups have double insulation between them and can have different voltages.

Important: within each group the inputs must be powered at the same voltage to avoid short-circuits or powering lower voltage inputs at 230 Vac.

The following figure represents an example for connecting the 230 Vac digital inputs on pRack models S, M, L.

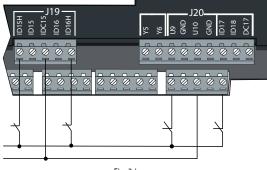

Fig. 3.i

3.4.1 Remote connection of the digital inputs

Important note: do not connect other devices to the digital inputs IDn inputs.

The Sizes of the cables for the remote connection of the digital inputs are shown in the following table:

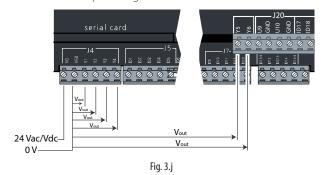

Size (mm ²) for length up to 50 m	Size (mm ²) for length until 100 m
0.25	0.5

If the product is installed in industrial environments (application of the EN 61000-6-2 standard) the length of the connections must be less than 30 m. This length shouldn't be exceeded in any case, to avoid measurement errors.

3.5 Connecting the analogue outputs

3.5.1 Connecting 0...10 V analogue outputs

The pRack PR300T provides 0...10 V optically-isolated analogue outputs, powered externally at 24 Vac/Vdc. The figure below shows the electrical connection diagram; the 0V (zero) of the power supply is also the reference for the output voltage:

Hardware Version	Terminals	Reference	
S, M	Y1, Y2, Y3, Y4	VG0	
L	Y1, Y2, Y3, Y4, Y5, Y6	VG0	
		Tab.	3.i

3.5.2 Optional modules

Module for converting a PWM analogue output to a liner 0...10 V and 4...20 mA analogue output (code CONV0/10A0)

The module is used to convert a PWM output (5 V pulses) to a liner 0...10 V and 4...20 mA analogue output (code CONV0/10A0). The control Signal (at the input terminals optically-isolated from the rest of the module) must have a maximum amplitude of 5V and a period between 8 ms and 200 ms. The 0...10 V output voltage can be connected to a maximum load of 2 k Ω , with a maximum ripple of 100 mV.

The 4...20 mA current output can be connected to a maximum load of 280 Ω , with maximum overshoot of 0.3 mA.

The mechanical dimensions of the module are 87x36x60 mm (2 DIN modules) with IP20 index of protection.

Module for converting a 0...10 V analogue output to an SPDT digital output (code CONVONOFF0)

The module is used to convert a 0...10 V analogue output to an ON/OFF relay output. The control Signal (at the input terminals, optically-isolated from the rest of the module), to ensure the switching of the relay from OFF to ON, must have a maximum amplitude of 3.3 V. The relay is SPDT, with max current of 10 A and max inductive load of 1/3 HP. The mechanical dimensions of the module are 87x36x60 mm (2 DIN modules) with IP20 index of protection.

3.6 Connecting the digital outputs

3.6.1 Electromechanical relay digital outputs

The pRack PR300T features digital outputs with electromechanical relays. For ease of installation, the common terminals of some of the relays have been grouped together. The following figure illustrates a connection example. If the following this diagram is used, the current at the common terminals must not exceed the rating (nominal current) of a single terminal (8 A).

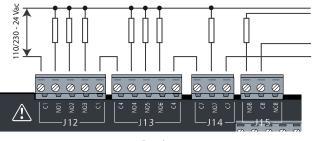

Fig. 3.k

The relays are divided into groups, according to the degree of insulation. Inside each group, the relays have just basic insulation and thus must have the same voltage (generally 24V ac or 110 to 230 Vac).

Between the groups there is double insulation and thus the groups can have different voltages. There is also double insulation from the rest of the controller.

Changeover outputs

Some relays feature changeover outputs, the number of changeover outputs depends on whether or not there are solid state relays (SSR) and consequently varies depending on the models.

Hardware Version	Changeover relay reference, without SSR model	Terminal
PRK30T**F* model	S	_
S	8	J15
Μ	8, 12, 13	J15, J17, J18

		Tab. 3.j

3.6.2 Solid state relay (SSR) digital outputs

The pRack PR300T also features a Version with solid state relays (SSR) on some models for controlling devices that require an unlimited number of switching cycles and thus would not be supported by electromechanical relays.

Important: the SSRs can control resistive loads powered at 24 Vac/ Vdc, maximum power Pmax= 10 W. For details see paragraph 2.2.2. The figure shows a connection example for resistive loads.

An example of resistive loads is illustrated in the the following figure:

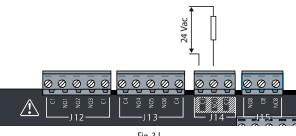

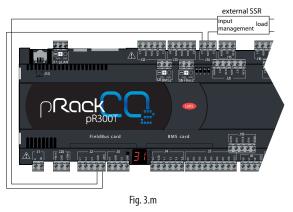

Fig. 3.I

The following figure illustrates correct applications for inductive loads.

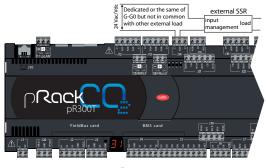

Fig. 3.n

The table below shows the reference outputs for pRack models fitted with SSR outputs.

Hardware Version	Reference Relay SSR	Terminal
S	7,8	J14, J15
M	7, 8, 12, 13	J14, J15, J17, J18
L	7, 8, 12, 13, 14, 15	J14, J15, J17, J18, J21
		Tab. 3.k

Important: the SSR relay load is powered at 24 Vac/Vdc, thus all the other terminals in the group must be powered at 24 Vac/Vdc due to the absence of double insulation within the group.

3.6.3 Summary table of digital outputs according to the Versions available

Hardware Version	NO contacts	NC contacts	changeover contacts	total no. of outputs	SSR relays
Models PRF	<100**A* and I	PRK100**B*			
Compact	5	-	-	7	2 (1, 2)
S	6	-	-	8	2 (7, 8)
Μ	9	-	2 (8, 13)	13	2 (7, 12)
L	12	-	2 (8, 13)	18	4 (7, 12, 14, 15)

Models PRI	<100**C* and	PRK100**D*	

IVIOUEIS PRP	VIUU C anu i	KKIUU D			
Compact	6	-	1 (1)	7	-
S	7	-	1 (8)	8	-
Μ	10	-	3 (8, 12, 13)	13	-
L	13	-	5 (8, 12, 13, 14, 15)	18	-
					Tab. 3.I

3.6.4 Remote connection of the digital outputs

The Sizes of the cables for the remote connection of the digital outputs are shown in the following table:

AWG	Size [mm ²]	Current [A]
20	0,5	2 A
15	1,5	6 A
14	2,5	8 A
		Tah 2 m

Tab. 3.m

If the product is installed in industrial environments (application of the EN 61000-6-2 standard) the length of the connections must be less than 30 m. This length shouldn't be exceeded in any case, to avoid measurement errors.

3.7 pLAN electrical connections

If the selected system configuration involves the connection of more than one pRack PR300T board in a pLAN, AWG20/22 twisted pair shielded cable must be used, with capacitance between the wires less than 90 PF/m.

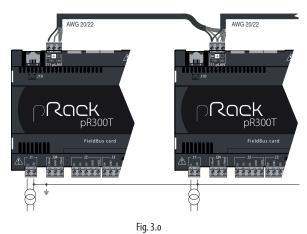

The maximum length of the pLAN network is 500 m with AWG22 twisted pair shielded cable.

The boards should be connected in parallel with reference to plug-in connector J5 (pRack Compact) or J11 (Versions S, M, L).

Important: follow the network polarity: RX/TX+ on one board must be connected to RX/TX+ on the other boards; the same applies to RX/TX-.

The figure shows the diagram for more than one board connected in a pLAN network powered by the same transformer; this is a typical application with more than one board connected inside the same electrical panel.

Important: pLAN connections are also possible with multiple boards powered by different transformers, for further details see the pCO Sistema manual, code: +030220335.

3.7.1 Connecting the terminals

pRack PR300T features PGDE terminals, both built-in and external connected via pLAN. Up to two external terminals can be connected, with pLAN addresses 31 and 32. The connection can be made using 6-wire telephone cables (connector J10 for S, M, L models) or shielded pair cables with 3-pin plug-in connectors (J11 for S, M, L models), as shown in the table:

Power supply distance	Power supply
10 m	Taken from pRack (150 mA)
10111	
200 m	Taken from pRack (150 mA)
500 m	Separate, from TCONN6J000
	10 m 200 m

Tab. 3.n

4. **START UP**

Starting the first time 4.1

After having correctly installed pRack, a number of preliminary operations are required to configure the installation.

Tutorial: the pRack PR300 configuration procedure varies according to the complexity of the installation:

- systems with only one board and maximum one external terminal. In this case, simply connect the terminal (if not built-in), power up the board and select one of the configuration solutions described below.
- systems with more than one board in pLAN or two external B. terminals. In this case, the additional operations described in Appendix A. 2 need to be completed before proceeding with configuration.

The procedure for configuring an installation described below is the same for all system configurations that feature just one pRack PR300 board, and for system configurations with more than one board connected in a pLAN.

When first starting the pRack PR300 board, after waiting around 1 minute, a screen is shown for choosing the language used to display the program (English or Italian).

Press ENTER (↔) to change the language displayed, while pressing ESC displays the following screen.

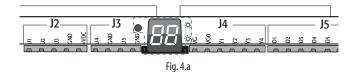

Note: If no option is chosen within a time set by parameter and visible on the screen, the current language remains selected.

After having selected the user interface language, the pRack PR300 software shows a screen for choosing between three possible system configuration solutions, as follows:

- Wizard
- · Advanced configuration.

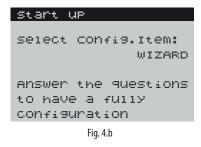

Important: after having configured the system, the configuration can be modified, it can be modified by repeating the same procedure, making sure the Carel default values have been reset. After having restored the defaults, the 7 segment display will show the number 88, the same as when first starting the controller. This means that the DEFAULT values have been restored correctly.

Important: after having configured the system, power down the controller and power up again.

Wizard 4.2

This solution is for obtaining the recommended configuration for the system. By responding to a series of questions, from screen to screen, the user is guided in choosing the devices that are present. Once the guided procedure is finished, the final obtainable results can be viewed (report) and, if the configuration is correct, direct installation can be performed of the parameters for pRack pR300T operation, including those associated with the inputs and outputs as described in paragraph 4.4.

Note: after having configured the parameters using the Wizard, the configuration can be modified manually, within the context of the selected system configuration.

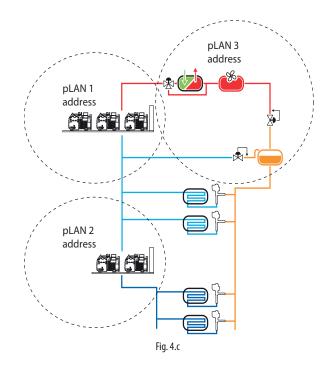

Important: before starting the pRack PR300T, carefully check the settings made automatically by the software.

Tutorial: the following paragraph shows a configuration example using the Wizard for an installation with two suction lines.

4.3 Example of system configuration using the Wizard

This describes a possible example of Wizard-led configuration for a type of system like the one shown in the figure, with 2 suction lines and part in high pressure (gas cooler and HPV, RPRV valves) on 3 different control boards:

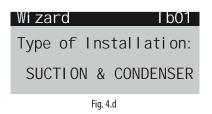

CAREL

The preliminary operations to be performed before configuration are:

- 1. with the boards not connect to the pLAN, power up the second and third pRack board and set the pLAN address to 2 and 3 (for details, refer to Appendix A.1)
- 2. remove power and connect the boards and any terminal to the pLAN as described in paragraph 3.7.
- 3. power the board and wait for the Wizard selection to appear

At this point, select the type of installation as SUCTION+CONDENSER:

Set the type of compressors and regulation of suction line 1 by answering the questions asked by the pRack pR300T software, for example:

Wizard Ib03
Compressor config.
Compressor type: RECIPROCATING
Compressor number: 3
Fig. 4.e
Wizard Ib40
Compressor config. Regulation by: PRESSURE
Measure unit: barg
Refrigerant: R744
Fig. 4.f
Wizard Ib41
Compressor config. Regulation type: PROPORTIONAL BAND
PROPORTIONAL BAND
Enable integral time action: YES

Fig. 4.g

After having configured suction line 1, the unit asks if another suction line needs to be configured, which must be answered YES:

Wi zard	1b43
Compressor confi	g.
Configure anothe suction line:	er YES
Fig. 4.h	

Answer YES to the next question which asks if a dedicated pRack board is present; this way the pRack pR300T software is ready to configure the board with address 2 in pLAN:

Wizard	1 b45
Compressor confi	a.
Dedicated pRack board for suction line:	YES

Fig. 4.i

After having answered the question to configure the second suction line, the software asks if there is a dedicated pLAN board for condensing line 1 In this example, answer YES.

	Wi zard	Ib9	0
	Condenser co	nfig.	
	Dedicated pR board for condensing I		S
	Fig. 4.j		
W	li zard	I b99	
E	as cooler config. EVS Managemant PU valve:	ENABLE	(*)
	PRV valve: alves routing:	ENABLE	(*)
	WIN A->HPV, B->RPF	2V	
Т	WIN A->HPV, B->RPF tatus:	RV Connected	

Note: (*) ENABLE, for valves driven directly by Carel driver, if you need 0-10V (as described in page 49, paragraph 6.15.1...), please set DISABLE

After having configured condensing line 1, the software asks if there is a condensing line 2; answer NO to this question:

Wizard I	b98
Configure another condensing line:	NO
Fig. 4.I	

At this point, the software asks if you wish to view a report of the settings performed:

Wizard	b2a
Enable I/O config: Visualize Wizard report:	YES
(Push (DOWN) to continue)	NO
Fig. 4.m	

If the settings are correct, you can proceed to install the set values:

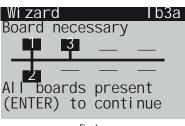

Fig. 4.n

After a few seconds, the unit can be started.

Note: after having configured pRack pR300T, the power must be turned off and back on in order to confirm that the data is saved.

4.4 Advanced configuration

Start UP Select Config.Item: ADVANCED CONFIGURATION It ONLY defines the Structure of the Plant For Very expert Users

Fig. 4.p

This solution allows you to establish the configuration for the pLAN structure needed for correct operation of the system.

Once the procedure for choosing the various factors that influence the final configuration is completed, the pRack pR300T software verifies if the pLAN configuration is exact and shows the user interface for configuring the parameters that must be manually performed by the user.

Attention: this configuration method is recommended only for expert users, since all system parameters must be manually configured.

4.4.1 Associating the inputs and outputs

When using pre-configurations and the wizard, pRack PR300T can automatically associate the board's inputs and outputs with the various functions.

For the wizard only, after having configured the lines, automatic association can be chosen as an option. If choosing not to use this function, the I/Os need to be configured manually, according to requirements.

The criteria applied for automatic association are described below.

Digital outputs

pRack PR300T assigns in order:

- Compressor outputs
- Fan outputs
- Global alarm.

Digital inputs

pRack PR300T assigns in order:

- High and low pressure switches (HP and LP)
- Compressor alarms
- Fan alarms

Note: pRack PR300T can also use certain analogue inputs as digital inputs, nonetheless the common HP and LP pressure switches are always associated with actual digital inputs.

Analogue inputs

pRack PR300T assigns in order:

- Pressure or temperature control probes for 1 or 2 lines, according to the settings made. The types of probe asSigned as default are 4...20 mA or 0 to 5 V (first 4...20 mA, then 0 to 5 V if necessary) for the pressure probes, NTC for the suction temperature probes and HTNTC for the condensing temperature probes;
- Suction temperature probe on line 1: if possible this is associated with input U3, otherwise the first free input;
- Discharge temperature probe on line 1;
- Suction temperature probe on line 2;
- Discharge temperature probe on line 2.

Analogue outputs

pRack PR300T assigns in order:

- Compressor inverters for 1 or 2 lines;
- Fan modulating devices.

USER INTERFACE 5.

Graphic terminal 5.1

The pRack PR300T user interface is represented by the pGDE terminal, panel or built-in versions. The functions associated with the 6 buttons on the pGDE terminal are the same on all the screens and are described in the table below.

Functions of the 6 buttons

Button		Function associated
(ALARM)		displays the list of active alarms and accesses the alarm log
Ο		used to enter the main menu tree
5		returns to the higher level screen
1	(UP)	scrolls a list upwards or increases the value highlighted by the cursor
1	(DOWN)	scrolls a list downwards or decreases the value highlighted by the cursor
ł	(ENTER)	enters the selected submenu or confirms the set value.
		Tab. 5.a

The LEDs associated with the buttons have the following meanings.

Meaning of LEDs

LED	Button	Meaning		
Red		Flashing: active alarms present and not acknowledged		
Steady: alarms present and acknowle		Steady: alarms present and acknowledged		
Yellow	Ο	pRack PR300T on		
Green	5	pRack PR300T powered		
	Tab 5 b			

ab. 5.b

5.2 Description of the display

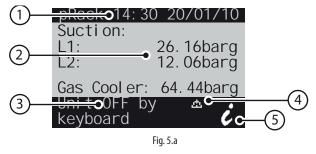

There are three fundamental types of screens shown to the user:

- Main screen
- Menu screen
- Screen for displaying/setting the parameters

Main screen

The main screen is the screen that the software on board pRack PR300T automatically returns to 5 minutes after the last button was pressed.

An example of the main sc	een is shown	in the figure,	highlighting the
fields and icons used:			

1	Time and date
2	Main values.

- 3 Unit status (unit off) or compressor and fan status (unit on)
- 4 Active alarm Signal and manual operation

Access further information screens (menu branch A.a) by pressing button

The information relating to the main values (Fig. 5.a) shown on the main screen when first starting vary according to the system configuration (one line, two lines, two lines with shared condenser) and the type of control value (pressure, temperature).

Note: The other information shown in menu branch A.a. varies according to the system configuration. For two line systems, pressing 🗲 from the main screen accesses a different screen based on the starting point (line 1, line 2).

Starting in version 3.3.0, the main screen can be modified, both in terms of the probe displayed and the value used, from the menu at: F.SETTINGS →b.Language→ Fb04

Main mask config FbO4
Probes configuration CONFIGURE
Info configuration: DON'T CONFIGURE

After having set the "probe configurations" (screen Fb04) under "CONFIGURE" and having pressed "ENTER" button, screen Fb05 can be accessed:

Main mask config	Fb05
L1-Suction: Pl	RESS.
12-Suction Pl	REŜŜ.
[Empty] Pl	RESS.
	EMPER.
	RESS.
Select prb info a	& UoM
Confirm conf ->	EXIT

Here, for example, the receiver pressure can be entered (rather than the discharge or intercooler temperature), the order of the probes shown can be reversed, and the saturated values of the probe readings displayed. In the same way, the positon of the compressor or fan status information in the unit status display (3, Fig.5.a) can be changed, accessing "CONFIGURE" for the "Info Configuration" field on screen Fb04:

Main mask config FbO4
Probes configuration
Probes configuration DON'T CONFIGURE
lpfo configuration
Info configuration: CONFIGURE
CONTROCKE

Once again, pressing "ENTER" accesses screens Fb09 and Fb10:

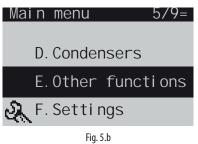

Main mask config Fb09 Double line config.						
l1% value: L1 - Compr. l2% value: L2 - Compr.						
1% 3% 🏝 2% 4% MAN 🕻						
Main mask config Fb10 Double line config.						
I 3% value: L1 - FANS I 4% value: HPV						

In this way, for example, the backpressure or flash gas valve opening percentage can be entered

Menu screen

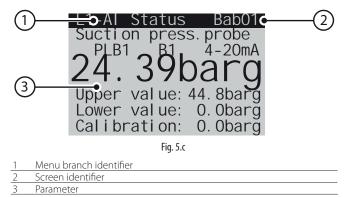

An example of a menu screen is shown in the figure below:

The top right corner shows the selected item and the current password level (for details see the following paragraph). The \uparrow and \checkmark buttons are used to select the desired menu item, while \Leftarrow accesses the selected item.

Screen for displaying/setting the parameters

An example of a screen for displaying/setting the parameters is shown in the figure, also highlighting the fields and icons used:

The screen identifier uniquely identifies the menu branch and the screen: the first characters indicate the menu branch, while the last two alphanumeric digits identify the order of the screen inside the menu, for example screen Bab01 is the first screen in menu B.a.b.

Note: The information on the screens may vary according to the password level used to access the menu.

5.3 Password

pRack PR300T manages three levels of password:

- User
- Maintenance
- Manufacturer

Each level includes the same rights as the lower levels, that is, the Manufacturer can access all the screens and parameters, the Maintenance can access the screens and parameters available in the Maintenance and User levels, while the User can only access the screens and parameters available in the User level.

Note: All levels display the main screens and the other information screens.

When pressing **O** a prompt is shown to enter the password, which remains active for 5 minutes after the last button is pressed.

The menu screens show their own password level using an icon at the top right: **1** line: user, **2** lines: maintenance, **3** lines: manufacturer.

The password level can be changed from menu branch F.c. at any time. The password can also be changed in the corresponding menu branch.

CAREL

Note:

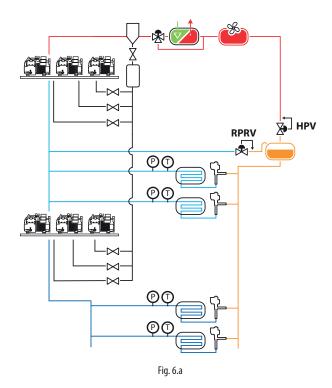

- The figure illustrates the maximum menu configuration visible with the Manufacturer password. If accessing with the User or Maintenance password, only the menu items available are visible
- For some menu items, access is possible with different password levels (e.g. I/O status), but the information available on the screens changes.

6. FUNCTIONS

6.1 Schematic diagram and system configurations used

ENG

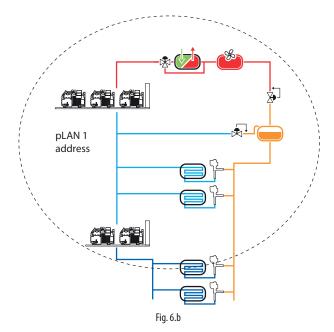

The schematic diagram of a transcritical system is shown in the figure:

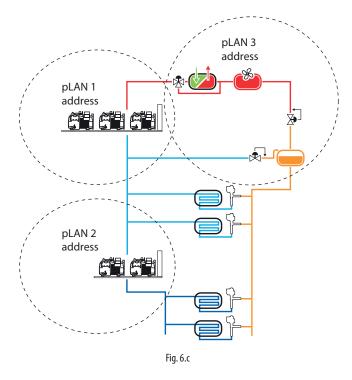

This shows the two medium and low temperature lines, the HPV valve, which separates the high pressure part of the circuit from the medium pressure part, and the RPRV valve which regulates the pressure in the receiver. Both valves can be managed directly by the controller with built-in driver (PRK30TD*).

Management of the system can be performed using one of the system configurations described hereafter.

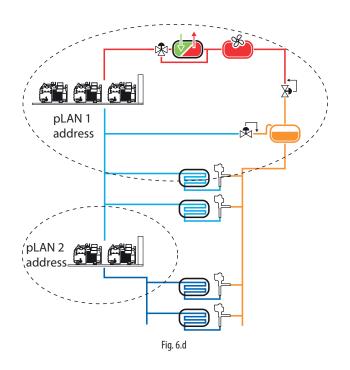

Configuration 1: a pRack pR300T board for managing both suction lines and control of the high pressure part (this configuration can be used also as a backup controller):

Configuration 2: 1 a pRack pR300T board for each suction line and 1 pRack pR300T board for control of the high pressure part (gas cooler and HPV, RPRV valves):

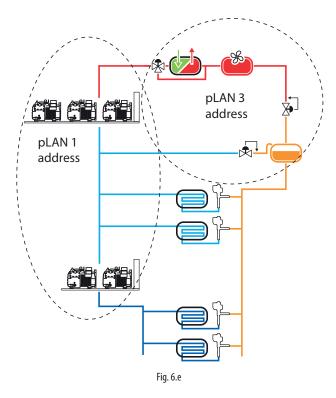

Configuration 3: a pRack pR300T board to manage the medium temperature suction line and control of the high pressure part and a board for managing the low temperature suction line:

<u>CAREL</u>

Configuration 4: a pRack pR300T board for managing the two suction lines and a board for control of the high pressure part:

6.2 Unit On-Off

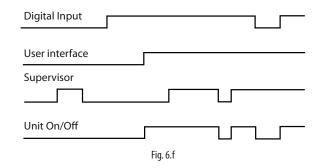

The unit can be switched on and off from:

- User terminal
- Supervisor
- Digital input

On-off from the user terminal and the configuration parameters are available under the main menu, branch A.c, and are differentiated based on the access level; the User password allows display only.

On-off from the supervisor and from the digital input and start-up after a blackout (with specific delay, to avoid continuous starts and stops in the event of instability in the power supply) must be enabled using the parameters visible only with the Manufacturer password.

On-off from the digital input is equivalent to an enabling Signal, that is, if the digital input is Off the unit cannot be switched on in any other way, while if is On, the unit can be switched on or off in any other way, with the same priority (the most recent control has precedence, whatever the origin), as shown in the figure:

When there are two suction and condenser lines, on-off is independent for each line, while when there are two suction lines and one condenser line, it is independent for the suction lines, while the condenser line stops when both suction lines are off, and starts when at least one suction line is ON. **Note:** certain special conditions or functions in the pRack software cause the unit to shutdown:

- Configuration of some parameters: e.g. inputs/outputs, configuration of compressors, inverter parameters.
- Installation of default parameters
- Manual management

6.3 Control

pRack PR300T can manage two types of control:

- Proportional band (P, P+I);
- Neutral zone (fixed times, variable times).

Both types of control can be applied to both compressors and condensers, according to the settings defined during start-up or in main menu branches C.a.b/C.b.b and D.a.b/D.b.b.

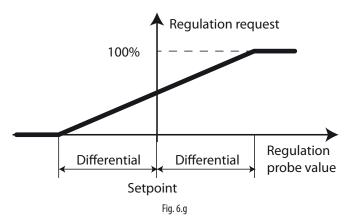

The type of control chosen is independent for each line present, either suction or condenser. In addition, pRack PR300T can use as the reference for control either the pressure or the converted temperature, or the temperature read by probe if there is no pressure probe, even if reference is only made to pressure below.

The control set point can be compensated by an offset linked to digital inputs, probes, supervisor or time bands, for details see paragraph 6.5 relating to compressor and fan energy saving. Both types of control are described below, and are valid for both control of suction pressure and condensing pressure, and operation with backup probes and/or probes not working.

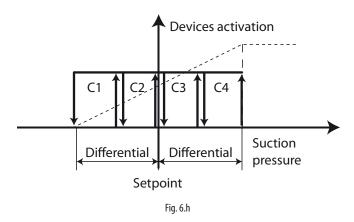

6.3.1 Proportional band

The operating principle is normal proportional or proportional + integral control (P, P+I).

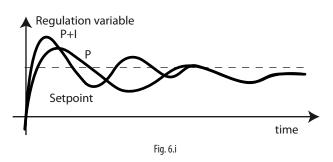

The control set point is central, consequently - for proportional control only - operation is schematised in the following figure:

For example, for 4 devices with the same capacity and proportional only control, start-up occurs as shown in the figure:

With P+I control, added to the effect of the proportional action described above is the integral action, used to achieve a null control error in steady operation, as shown in the figure:

The integral action depends on the time and the deviation from the set point. This modifies the request if the control value does not approach the set point for some time.

The integral time setting represents how fast integral control is implemented:

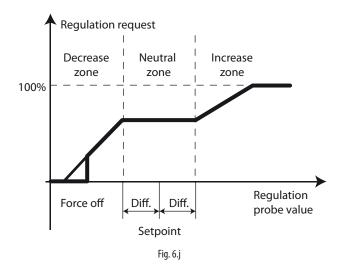

• low values determine fast and intense control action

• high values determine slower and more stable control action It is recommended to not set a value that is too low for the integral time, to avoid instability.

Note: the set point is in the centre of the activation band, therefore when reaching the set point some devices are on, even with purely proportional control.

6.3.2 Neutral zone

The operating principle is schematised in the following figure:

Inside the neutral zone the capacity request sent by the controller is constant (except when there is a modulation device and modulation is enabled inside the neutral zone, as described in the following paragraph) and the value satisfies the temperature control request in those specific operating conditions, therefore within this zone no device is stopped or started.

In the decrease zone, the request also decreases at a rate that depends on the deviation from the set point, and vice-versa in the increase zone the request increases proportionally to the deviation.

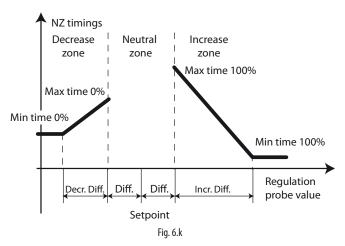

For the increase and decrease zones, the following can be used:

- Fixed times: the request decreases or increases constantly as time elapses.
- Variable times: the request decreases or increases more quickly (according to the settings) as the deviation from the set point increases.

Note: The previous figure shows the increase and decrease with fixed times.

For control in Neutral zone, the parameters shown in the figure must be set:

As well as the decrease and increase differentials, 4 times need to be set, two for each zone, which represent the maximum and minimum time to reach the request, equal to 0% or 100%, for the decrease and increase respectively.

Tutorial: the decrease/increase times (minimum and maximum) represent the time needed to change from maximum to minimum capacity and vice-versa, and not the time between the deactivation/ activation of the individual device. For example, in the case of 4 devices with the same capacity, an increase time of 180 s means that one device is activated every 45 s.

In the situation shown in the figure, the request sent by the controller decreases/increases slowly as soon as the controlled value is outside of the Neutral zone, while it decreases/increases quickly the further the controlled value moves away from the Neutral zone; in this way the response of the system is faster when further from steady conditions.

Note: When using fixed times, the maximum and minimum must be set to the same value. In this case, the request sent by the controller decreases/increases constantly inside the deactivation/ activation differential.

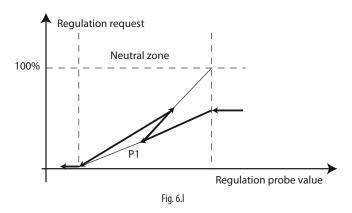

6.3.3 Modulation in Neutral zone

pRack PR300T can activate a specific function inside the Neutral zone if modulating devices are used (e.g.: inverters). This function can be enabled in main menu branch C.a.g/C.b.g or D.a.g/D.b.g.

Modulation in Neutral zone is used to vary the request sent by the controller inside the Neutral zone proportionally so as to enter the decrease zone with the minimum request and the increase zone with the maximum request, meaning a device can be immediately deactivated/ activated when exiting the Neutral zone.

This makes it possible to remain longer inside the neutral zone without starting or stopping any device.

An example of this operation is shown in the figure:

CAREL

When entering the Neutral zone, the pRack PR300T software calculates how the request needs to change in order to exit the Neutral zone at minimum or maximum output, and applies one of the two values according to the trend in variation in the control variable. For example, at point P1 in the figure, the trend of the two requests is represented by the segments with thin lines, and the request 'reverses' because at that point the control variable has started increasing in value again.

Note: When exiting the Neutral zone, it is possible that the request is not at the minimum or maximum value, where limitation is enabled for of the modulating device variation speed.

6.3.4 Control with backup probes and/or probes not working

pRack PR300T can use backup control probes that are activated when the normal control probes are not working.

The backup probes must be enabled in main menu branch C.a.g/C.b.g or D.a.g/D.b.g.

When different pRack boards are used to manage the suction and condenser lines, the backup suction pressure probe must be connected to the board that manages the suction line, while the backup condensing pressure probe can be connected either to the board that manages the suction line or the board that manages the condenser line.

If the main control probes are not working and no backup probes are fitted, or the backup probes are also not working, or the corresponding temperature probes are also not working, fixed values are used for the control request, set in main menu branch C.a.g/C.b.g or D.a.g/D.b.g.

6.4 Compressors

pRack PR300T can manage up to 2 suction lines with different types of compressors and capacity modulation devices, applying common types of device rotation and controlling both the start mode and the safety times for each type of compressor, as well as a number of accessory functions. The compressor functions and related parameter settings are enabled from main menu branch C.a/C.b. These features and functions are described in detail in the following paragraphs.

6.4.1 Possible compressor configurations

pRack PR300T can manage different types of compressors:

- Reciprocating
- Scroll

Moreover, a capacity modulation device is allowed for each suction line, which may be one of the following, according to the type of compressor:

Compressors and modulation devices

Compressors	modulation devices
Reciprocating	Inverter
C	Inverter
Scroll	Digital Scroll™
	Tab. 6.a

Note: The same modulation device is used on each line.

The maximum number of compressors and load stages per line varied according to the type of compressor:

Compressors and modulation devices

Compressors	Maximum No.	Load stages	
Reciprocating	12	24 total	
Scroll	12	24 total	
			Tab. 6.b

The compressor size refers to its capacity and number of load stages or to the inverter presence, therefore different sizes need to be defined for compressors with the same capacity yet a different number of load stages. The inverter is always associated to size 1.

- Tutorial: below is one example of some possible configurations:
- One line, 4 reciprocating compressors with the same capacity, the first with inverter (2 sizes).
- One line, 4 scroll compressors with the same capacity, the first Digital Scroll™ (1 sizes).
- One line, 4 reciprocating compressors with the same capacity, the first two with 4 load stages, the other two not capacity-controlled (2 sizes).
- One line, 4 reciprocating compressors with the same capacity and 4 load stages each (1 size).
- Two lines, line 1 with 4 scroll compressors, the first Digital Scroll[™], line 2 with 4 reciprocating compressors, the first with inverter (1 size line 1, 2 sizes line 2).

6.4.2 Rotation

pRack PR300T can manage 4 different types of device rotation:

- FIFO (First In First Out): the first device to start is also the first to stop
- LIFO (Last In First Out): the last device to start is the first to stop
- By time: the device with the least number of operating hours starts and the device with highest number of operating hours stops
- Custom: the on/off sequences are defined by the user

NB: Different Sizes of compressors can only be managed with Custom rotation.

The type of rotation is selected and the corresponding parameters set during the start-up procedure or in main menu branch C.a.f/C.b.f. The activation thresholds are calculated differently depending on whether FIFO, LIFO, time or Custom rotation is used:

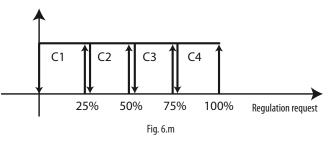

Device activation threshold calculation

Rotation	Threshold calculation
FIFO	Static: the range of variation of the control request is divided equally between the number of stages available
LIFO	
By time	
Custom	Dynamic: the thresholds are calculated depending on the
	capacity effectively available
	Tab 6 c

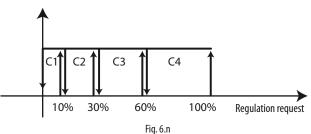

Tab. 6.c

Example 1: FIFO rotation, 4 compressors of the same capacity without load stages.

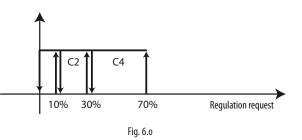

The activation thresholds are 25, 50, 75 and 100 %.

Example 2: Custom rotation, 4 compressors with capacities of 10, 20, 30 and 40 kW. The activation thresholds with all the compressors available are 10, 30, 60, 100 %.

If an alarm is active on compressor 3, the recalculated activation thresholds are 10, 30, 70 %.

Activation of the compressors and load stages may be:

- Grouped (CpppCppp): first all the load stages are activated on one compressor before starting the next one
- Balanced (CCpppppp): first all the compressors are started at minimum capacity and then the corresponding load stages are activated, one for each compressor, in sequence.

6.4.3 Rotation with modulation devices

pRack PR300T can also manage compressor rotation when a capacity modulation device is fitted (inverter, Digital Scroll™ or continuous control). The type of modulating device is selected and the corresponding parameters set during the start-up procedure or in main menu branch C.a.f/C.b.f and C.a.g/C.b.g

The modulating device is always the first to start and the last to stop irrespective of the type of rotation, the other devices start or stop according to the type of rotation selected.

Note: The compressor with modulation device is also assumed to be the first.

The trend in capacity delivered by the modulation device depends on the capacity of the compressor with the modulating device compared to the other compressors available.

Three cases can be identified:

- compressors all with the same capacity and range of capacity variation of the modulating device greater than or equal to the capacity of the compressors
- compressors all with the same capacity and range of capacity variation of the modulating device less than the capacity of the compressors
- compressors with different capacities

In the first case, the modulating device manages to continuously cover the range of variation of the control request, while in the second case some discontinuous variations remain. The behaviour in the third case varies according to the capacities involved, and in any case reflects one of the two previous cases.

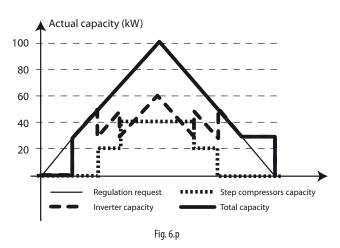

To configure the compressor capacity when an inverter is used, the minimum and maximum operating frequencies need to be set relating to the minimum and maximum value of the analogue output and the rated capacity delivered at rated frequency (50 Hz), so that the pRack PR300T software can calculate the capacity the compressor can deliver with the inverter and use this value for control. In addition, for inverters the variation in capacity delivered can be limited by setting the increase and decrease times. If these times have already been configured on the inverter, the higher time set has priority.

Example 1: range of modulating device capacity variation higher than the capacity of the compressors:

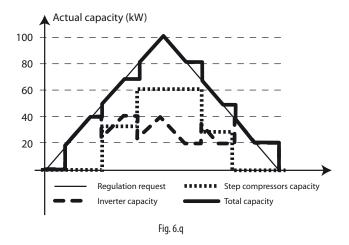

Two compressors without capacity control, with the same capacity, 20 kW each, modulating device with variable capacity between 30 and 60 kW. The figure shows the trend when the request sent by the controller increases and then decreases continuously between 0 and 100 %.

It can be seen that the capacity delivered exactly follows the required capacity, except when below the minimum capacity of the modulating device.

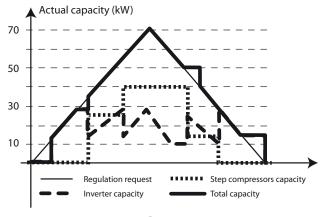

Example 2: range of modulating device capacity variation lower than the capacity of the compressors: two compressors without capacity control, with the same capacity, 30 kW each, modulating device with variable capacity between 20 and 40 kW.

It can be seen that the capacity delivered does not exactly follow the required capacity, rather acts in steps, so as to avoid swings.

Example 3: range of modulating device capacity variation in between the capacity of the compressors, all different sizes: two compressors without capacity control, capacities 15 kW and 25 kW, modulating device with variable capacity between 10 and 30 kW.

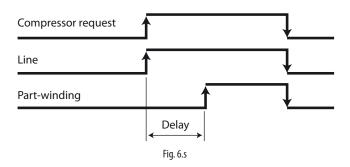

Starting 6.4.4

pRack PR300T can manage different types of compressor starting:

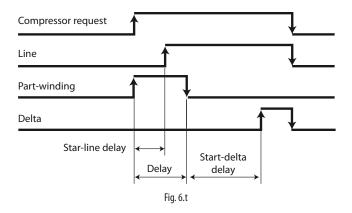

- Direct
- Part-winding
- Star/delta

The type of starting can be selected and the related parameters set in main menu branch C.a.f/C.b.f.

For part-winding starting, the delay in activating the digital output that controls the second winding needs to be set:

For star/delta starting, the star time, the delay between the activation of the line and star digital input, and between the delta and star digital input all need to be set, as shown in the figure:

Safety times 6.4.5

pRack PR300T can manage common safety times for each compressor:

- Minimum on time
- Minimum off time
- · Minimum time between consecutive starts

The related parameters can be set in main menu branch C.a.f/C.b.f.

Note: for two lines, a further delay can be set between starts of the compressors on different lines, so as to avoid Simultaneous starts. See paragraph 6.6.6 for the detailed description of the synchronisation function for two lines (DSS).

Balancing 6.4.6

pRack PR300T can control any balance valves in parallel with the compressors.

This function can be used to activate a communicating solenoid valve between compressor suction and discharge, for a set time, before each individual compressor starts. In this way, the suction and discharge pressure can be balanced and the compressor can be started in more favourable conditions.

The balancing function can be enabled and the related activation time set in main menu branch C.a.f/C.b.f.

6.4.7 **Economizer**

pRack PR300T can activate the economizer function to boost compressor efficiency by injecting vapour. Some of the liquid is taken from the condenser, expanded through a valve and then sent to a heat exchanger to cool the liquid leaving the condenser. The resulting superheated vapour is injected into a special section of the compressor.

The function can be enabled and the related parameters set in main menu branch E c a b

The economizer is only efficient for high compressor activation capacities, typically over 75 %, therefore the economizer function control valve is only activated when exceeding a set threshold.

As the economizer tends to increase the condensing pressure, this needs to be controlled to ensure the high condensing pressure alarm is not generated. In addition, the injection of vapour decreases the discharge temperature and so this value also needs to be monitored.

Consequently, the three conditions for activation of the economizer function are:

- · Capacity above a set threshold
- Condensing pressure below a set threshold (with reset differential)
- Discharge temperature above a set threshold (with reset differential)

Note: the function can be activated on a maximum of 6 compressors.

6.4.8 Liquid injection

As an alternative to the economizer, pRack PR300T can manage the injection of liquid into the compressors (the two functions are alternative, as the point of vapour injection into the compressor is the same).

The function can be enabled and the related parameters set in main menu branch E.d.a.b/E.d.b.b.

Liquid injection is used to protect the compressor, and in fact decreases the discharge temperature. Operation is Similar to the economizer function, with the difference that the expanded liquid is not sent to a heat exchanger, but rather directly into the compressor. The function is only activated when the compressor is on and the discharge temperature exceeds a set threshold (with differential).

Manual operation 6.4.9

pRack PR300T can manage 3 different compressor manual operating modes:

- Enabling / disabling
- · Manual management
- Output test

Enabling / disabling is managed in main menu branch C.a.f/C.b.f., while manual management and the output test can be activated in main menu branch B.b or B.c.

Enabling / disabling is used to temporarily exclude the compressors from operation, to allow, for example, repair or replacement. The disabled compressors are also excluded from rotation.

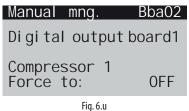

Note: enabling is the only compressor manual operating mode that can be activated when the unit is on.

Both manual management and the output test are enabled by parameter and remain active for a set time after the last button is pressed, after which the unit returns to normal operating mode.

Manual management is used to switch the compressors on or off without observing the control needs, however still considering any safety devices (alarms, safety times, starting procedures) and respecting the set configuration of the inputs/outputs.

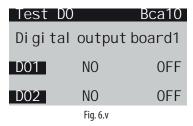

The activation screen resembles the one shown in the figure and is used to override the outputs relating to the operation of the selected device, e.g. compressor 1:

The output test is used to activate or deactivate the outputs (where necessary setting an output percentage for the analogue outputs), without observing any type of safety feature.

The activation screen resembles the one shown in the figure and is used to override the outputs on the pRack boards, in the order they physically appear on the board (without links to the devices):

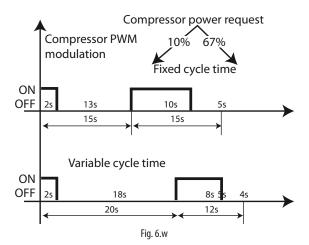

Important: manual mode and the output test can only be activated with the unit off.

Both manual mode and above all the output test must be used with special care and by expert personnel to avoid damage to the devices.

Digital Scroll[™] compressors

pRack PR300T can use a Digital Scroll[™] compressorä as the modulating device for suction lines (one for each line). This type of compressor features special operation, and is controlled by pRack PR300T as follows.

The related parameters can be set in main menu branch C.a.f/C.b.f. The capacity is modulated by opening/closing a valve with PWM; when the valve is ON the compressor delivers minimum capacity, while when the valve is off the compressor delivers maximum capacity. In the following description and figure, ON and OFF refer to the status of the compressor, while operation of the valve is the exact opposite:

The following data are provided by the manufacturer of the compressor: • minimum ON time 2 s

- maximum cycle time 20 s
- optimum cycle time 12 s

There are three possible operating modes:

- Fixed cycle time
- Variable cycle time
- Optimised cycle time

Based on the operating mode selected, pRack PR300T calculates the valve activation percentage that satisfies the required capacity.

Fixed cycle time

The compressor ON time is calculated as the percentage of the cycle time corresponding to the required capacity:

T_{on}= % Richiesta * Tempo di ciclo

The cycle time can be set to the optimum value suggested by the manufacturer to achieve maximum COP, or to a higher value to increase resolution of the capacity delivered (a higher cycle time implies greater continuity in the effective capacity that can be delivered).

Variable cycle time

The compressor ON time is set to 2 s and the cycle time is calculated based on the required capacity:

Optimised cycle time

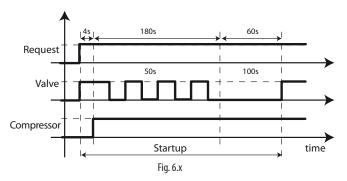

The compressor ON time is set to 2 s and the cycle time is calculated based on the required capacity for capacities less than 17 %, after which the cycle time is set to 12 s and the ON time varies. In essence, this mode is a combination of the previous two. This guarantees the maximum possible COP and control rate (obtained with the 12 s cycle time) and the maximum control range (starting from 10 %).

Note: the minimum capacity that can be delivered by Digital ScrollTM compressors is Minimum ON time/Maximum cycle time = 2/30 = 6.7 %, which also depends on the selected control mode (for example, in the first case shown in the figure the minimum capacity delivered is Minimum ON time/Cycle time = 2/15 = 13%).

Note: if high pressure prevention is enabled with activation/ deactivation of the devices, the Digital Scroll[™] compressor delivers the minimum possible capacity.

Starting procedure

pRack PR300T can manage the specific starting procedure for Digital Scroll™ compressors, as represented as in the following figure:

There are three stages:

- balance: the PWM valve is activated for 4 s, so that the compressor delivers minimum capacity;
- 2. compressor activation with 50 % capacity for 3 minutes;
- 3. forced operation at 100 % for 1 minute.

During the starting procedure, the request sent by the controller is ignored and only at the end of the procedure does the capacity delivered start reflecting the request. If the request is cancelled during the starting procedure, the compressor stops at the end, then the minimum ON time for these types of compressors is set to 244 s.

The starting procedure is performed when the compressor is started, while it can be disabled for a set time by parameter for subsequent starts, if the compressor has not remained off for a minimum set time. After this time has elapsed the procedure is performed again during the following start.

Note: the safety times for Digital Scroll[™] compressors are established by the manufacturer, and are as follows:

- Minimum ON time: 244 s (starting procedure)
- Minimum OFF time: 180 s
- Minimum time between restarts: 360 s

Alarms

pRack PR300T can manage, in addition to the common alarms for all types of compressors (see chapter 8 for details), some specific alarms for Digital Scroll[™] compressors:

- high oil temperature
- oil dilution
- high discharge temperature

These alarms are managed as specified by the manufacturer of the compressor, and therefore pRack PR300T can only enable or disable them. Activation of these alarms requires an oil temperature probe, which can also be the common probe (see the paragraph relating to oil management) and the compressor discharge temperature probe.

▶ Note: pRack PR300T does not manages the envelope for Digital Scroll[™] compressors and consequently there is no corresponding alarm when operating outside the envelope.

6.5 Gas cooler

pRack pR300T manages the gas cooler in a manner that is completely similar to the pRack PR300T for the condensers, with the only difference being that in transcritical condition, since correspondence between the pressure and saturated temperature is lost, the regulation is always in temperature di default ma è possibile a partire dalla versione 3.1.5 regolare i ventilatori anche in pressure. The regulation variable, therefore, is the output temperature from the gas cooler.

Up to 16 fans can be managed, also with inverter modulation. In the event of modulation, the modulating output 0...10 V is unique while an input can be managed for each fan for signalling the alarms.

The functionalities can be enabled and the relative parameters can be set from main menu branch D.a.

6.5.1 Control

pRack PR300T can manage proportional band and Neutral zone control, by pressure or temperature.

For details on the control modes, see the corresponding paragraph, while below is the description only of the features relating to the fans.

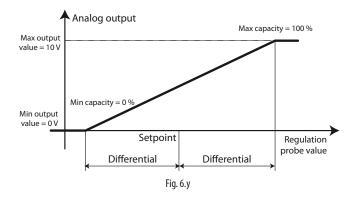

Fan operation depending on the compressors

The operation of the fans can be bound to the operation of the compressors by setting a parameter in main menu branch D.a.b/D.b.b, in this case the fans only start if at least one compressor is on. This setting is ignored if the fans are controlled by a dedicated pRack PR300T board and the pLAN network is disconnected.

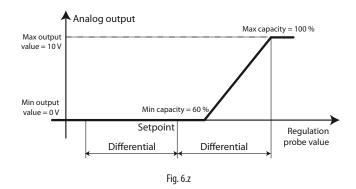

Fan operation with modulating device

If the fans are controlled by a modulating device, the meaning of the parameters that associate the minimum and maximum values of the device's modulating output and the minimum and maximum capacity of the modulating device on screens Dag02 and Dbg02 is illustrated in the following examples.

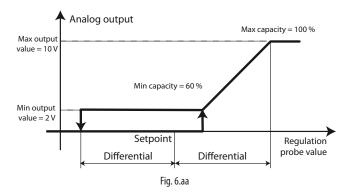

Example 1: minimum modulating output value 0 V, maximum value 10 V, minimum modulating device capacity 0 %, maximum 100 %.

Example 2: minimum modulating output value 0 V, maximum value 10 V, minimum modulating device capacity 60 %, maximum 100 %.

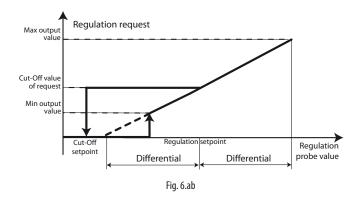

Example 3: minimum modulating output value 2 V, maximum value 10 V, minimum modulating device capacity 60 %, maximum 100 %.

Cut-off

pRack PR300T manages a control cut-off for the fans; functions and related parameter settings can be enabled from main menu branch D.a.b/D.b.b. The operating principle of the cut-off function is shown in the figure:

A percentage of the control request and a cut-off set point can be set. When the control request reaches the set cut-off value, this value is kept constant until the control value falls below the cut-off set point, after which it falls to 0 % and remains there until the request exceeds the cut-off value again.

6.5.2 Rotation

pRack PR300T can manage rotation of the fans, much in the same way as described for the compressors, therefore:

- LIFO, FIFO, time, Custom rotation
- Management of a modulation device on each line

The substantial difference compared to the compressors concerns the possibility to manage different capacities and load stages, which are obviously not featured for the fans. In addition, pRack PR300T can specially manage inverter driven fans. In fact, a multiple number of inverter driven fans can be set.

If there is more than one fan, however the number of inverter driven fans is set to 1, the fans are started and stopped at the same time, and the fans will always all be at the same power.

If there is more than one inverter driven fan, as well as being able to use an alarm digital input for each, it is assumed that the weight of the modulating device is proportional to the number of fans, therefore the first case is applied, as described previously: fans all with the same power and modulating device power variation range greater than or equal to the capacity of the other devices.

Example 1: 4 fans all controlled by the same inverter correspond to 1 fan with four times the power.

Note: some fans can be excluded from the rotation, for example in the winter; to do this use the split condenser function.

6.5.3 Fast start (speed up)

pRack PR300T can manage the fast start function (speed up), used to overcome the initial inertia of the fans. The function can be enabled and the related parameters set in main menu branch D.a.g If speed up is enabled, a start time can be set in which the fan speed is forced to 100%. If the outside temperature sensor is used, moreover, a threshold can be set (with reset differential) below which speed up is disabled, so as to not drastically lower the condensing pressure at start-up.

Note: speed up has lower priority than the Silencer function (see the following paragraph for the details), therefore if the Silencer function is active, this is disabled.

6.5.4 Silencer

pRack PR300T can manage the Silencer function, used to limit fan speed at certain times of the day or in specific conditions, enabled by digital input.

The function can be enabled and the related parameters set in main menu branch D.a.g.

Enabling fan speed limitation from the digital input or based on time bands is independent, consequently the speed is limited to the set value when at least one of the two conditions is active.

Up to 4 activation bands can be set for each day of the week.

6.5.5 Split condenser

pRack PR300T can manage the possibility to exclude some fans from operation, for example to reduce gas cooler operation in winter, using the split condenser function.

The function can be enabled and the related parameters set in main menu branch D.a.g.

Split condenser can be used to exclude from rotation fans whose index is:

- even
- odd
- higher than a settable value
- lower than a settable value

The function can be activated by:

- time bands (winter/summer seasons)
- digital input
- supervisor
- outside temperature (set threshold and differential)

D Note:

- the split condenser function can be disabled by parameter if the high pressure prevention function is activated. If split condenser is disabled due to activation of the high pressure prevention function, it remains disabled for a set time, after which it is reactivated.
- split condenser cannot be enabled if there is a speed modulation device that controls all the fans.

6.5.6 Manual operation

pRack PR300T can also manage the same three manual operating modes for the fans as described for the compressors:

- Enabling
- Manual management
- Output test

Enabling is managed in main menu branch D.a.f/D.b.f., while manual management and the output test can be activated in main menu branch B.b or B.c. For the detailed description of the three modes, see paragr. 6.3.9.

6.5.7 Alarms

pRack PR300T can manage both a common alarm for the fans and separate alarms for each fan.

When the common alarm is active the alarm is signalled, but no fan is stopped, while for separate alarms the fan that the alarm refers to is stopped.

6.6 HPV valve management

Management of the HPV valves, which separates the high pressure part of the system from the medium pressure part, determines the transcritical and subcritical operation mode of the unit. In transcritical mode, valve regulation is done to obtain maximum yield while in subcritical mode, regulation controls the subcooling. The HPV valve has a proportional + integral (PI) type of regulation which uses an optimal pressure value of the gas cooler calculated on the basis of the gas cooler pressure and temperature as a regulation setpoint, as described hereafter.

Enabling HPV valve management coincides with enabling the transcritical system management mode.

The HPV valve can be managed directly by pRack pR300T with builtin driver (PRK30TD***) or with external EVD EVO driver. Both solutions are compatible with the majority of valves available on the market. Direct control via serial connection is enabled under EEVS (electronic expansion valve settings), accessible from the main menu, branch E.i.c. The configuration parameters, on the other hand, are accessible from the main menu, branch E.i. The algorithm for calculating the regulation setpoint of the HPV valve can be optimized or customized by the user according to what was set by the parameter.

Calculation of the optimized setpoint

The calculation of the optimized setpoint is illustrated in the figure.

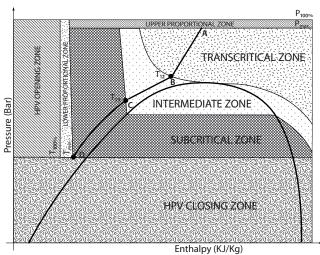

Fig. 6.ac

<u>CAREL</u>

The HPV valve is managed according to the zone identified based on the output temperature and gas cooler pressure.

In order to define the zones, it is necessary to set the two pressure values $P_{100\%}$ and $P_{max'}$ the two temperatures $T_{12'}\,T_{23}$ related to points B and C in the figure and the two temperatures T_{min} and $T_{100\%}$.

In the following, with $\rm T_{gc}$ and $\rm P_{gc'}$ the temperature and pressure of the gas cooler will be indicated.

The behaviour of the HPV valve in the various zones is as follows:

- **Transcritical zone**, identified by $T_{gc} \ge T_{12}$ and $P_{gc} \le P_{max}$: the valve works with proportional + integral (PI) type integration in order to maintain the maximum COP given by the optimal pressure P_{opt} calculated as a function of the output temperature from the gas cooler T_{opr} .
- Subcritical zone, identified by $T_{min} \le T_{gc} \le T_{23}$; the valve works with PI regulation in order to maintain constant subcooling.
- Transition zone, identified by $T_{23} \le T_{gc} \le T_{12}$: the valve works with PI regulation with a pressure setpoint identified as the conjunction of points B and C in the figure, obtained by calculating the optimal pressure at the limit of the transcritical and subcritical zones. The purpose of this zone is to avoid discontinuity in passing between the two zones.
- Upper proportional zone, defined by $P_{max} < P_{gc} < P_{100\%}$: the valve works with only proportional regulation between the opening value reached at pressure P_{max} and the maximum opening value at pressure $P_{100\%}$. If the pressure decreases, the opening value of the HPV valve remains constant until it enters the transcritical zone, in which the regulation restarts as previously described.
- Lower proportional zone, defined by $T_{100\%} < T_{gc} < T_{min}$; the valve works with only proportional regulation between the opening value reached at temperature T_{min} and the maximum opening value at temperature $T_{100\%}$. If the pressure increases, the opening value of the HPV valve remains constant until it enters the subcritical zone, in which the regulation restarts as previously described. It is possible to disable operation according to this mode by parameter.

Calculation of the customized setpoint (custom)

The customized calculation differs from the optimized control due to the fact that the curve in the subcritical phase is rectilinear and defined by the user, therefore the definition of the bands and the calculation of the setpoint can be customized by the user. Behaviour in the remaining bands is as described for the optimized algorithm.

HPV valve accessory functions

HPV valve management includes some accessory functions:

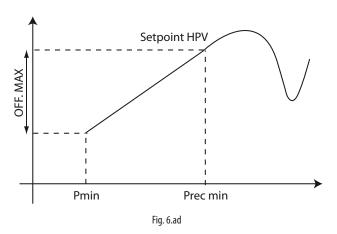

- Pre-positioning: entering the unit ON status, the HPV valve remains at a fixed position that can be set by a parameter for a fixed time, which is also settable by a parameter, in order to be able to quickly raise the pressure in the tank. This procedure is reactivated whenever the unit goes into the OFF status or the HPV valve moves into the minimum position due to all of the compressors being turned off (optional).
- Valve closure with compressors off: if all compressors in the medium temperature unit are turned off, the HPV valve can be positioned at the minimum opening value in the OFF status, which can be set by a parameter. When a compressor is restarted, the valve restarts the regulation with the pre-positioning procedure described in the previous point.
- Minimum and maximum opening values: the minimum opening value in Off status and in ON status can be differentiated (by keypad, digital input or supervisor) which the maximum opening value is unique.
- Maximum percentage variation: the movement of the valve cannot exceed the maximum set percentage variation per second.
- Filter on setpoint: the calculation of the regulation setpoint of the HPV valve can be done by taking into account the averages of the last *n* samples (maximum 99) to avoid sudden variations due to high variability of the output temperature of the gas cooler.
- Minimum setpoint: a minimum value can be set for the HPV valve setpoint, below which the setpoint can never go regardless of the parameters entered, in order to preserve the operation of the compressors.
- Setpoint distance alarm: if the gas cooler pressure is too far from the calculated setpoint for too long (threshold and delay can be set), an alarm can be triggered.

6.6.8 Control of the receiver pressure through the HPV valve

If the pressure in the receiver goes below the minimum work pressure set, the dynamic calculated setpoint for the HPV valve can be changed in order to increase the pressure in the receiver.

An offset in proportion to the distance from the minimum threshold is subtracted from the calculated setpoint so that the greater opening of the HPV valve contributes to increasing the pressure in the receiver.

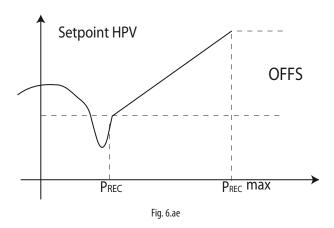

The offset is directly proportional to the distance from the minimum work threshold, as illustrated in the figure:

On the other hand, if the pressure in the receiver goes above the maximum work pressure set, the dynamic calculated setpoint for the HPV valve can be changed in order to decrease the pressure in the receiver.

An offset in proportion to the distance from the maximum threshold is added to the calculated setpoint so that the lesser opening of the HPV valve contributes to decreasing the pressure in the receiver.

The offset is directly proportional to the distance from the maximum work threshold, as illustrated in the figure:

6.6.9 Summary of inputs, outputs and HPV valve par.

The following is a summary table of the inputs/outputs used and the parameters with indications of the related configuration screens. For details, refer to Appendix A.1.

Summary of inputs/outputs and HPV valve parameters

	Mask	Description
Analog inputs	Bab04, Daa39	Gas cooler pressure
	Bab61, Daa43	Gas cooler output temperature
	Bab09, Daa40	Gas cooler backup pressure
	Bab62, Daa44	Gas cooler output backup temperature
Digital inputs	Baade, Eia04	HPV valve alarm
Analog outputs	Bad14, Eia06	HPV valve output
Digital outputs		

Parameters

Settings	Eib01	HPV valve management enabled, or transcritical
5		operation mode enabled
		Selecting the type of algorithm to apply to the
Zone	Eib05	calculation of the pressure setpoint P P P P
definition	LIDOD	IP pressure for defining the upper proportional zone
		P _{critic} optimal pressure calculated at the passage
		temperature between the intermediate zone and

	Eib28	valve output Minimum HPV valve regulation setpoint
	LIDZO	Enable low temp. control (lower proportional zone)

6.7 RPRV valve management

Management of the RPRV valve, which is a PI regulation, is to maintain the pressure inside the CO_2 receiver equal to the setpoint. The RPRV valve can be managed directly by pRack pR300T with built-in driver (PRK30TD***) or with external EVD EVO driver. Both solutions are compatible with the majority of valves available on the market. Direct control via serial connection is enabled under EEVS (electronic expansion valve settings), accessible from the main menu, branch E.i.c. The configuration parameters, on the other hand, are accessible from the main menu, branch E.i.

6.7.1 RPRV valve accessory functions

RPRV valve management includes some accessory functions:

- Pre-positioning: entering the unit ON status, the RPRV valve remains at a fixed position that can be set by a parameter for a fixed time, also settable by a parameter, in order to be able to quickly raise the pressure in the tank. This procedure is reactivated whenever the unit goes into the OFF status or the RPRV valve moves into the minimum position due to all of the compressors being turned off (optional).
- Valve closure with compressors off: if all compressors in the medium temperature unit are turned off, the RPRV valve can be positioned at the minimum opening value in the OFF status, which can be set by a parameter. When a compressor is restarted, the valve restarts the regulation with the pre-positioning procedure described in the previous point.
- Minimum and maximum opening values: the minimum opening value in Off status and in ON status can be differentiated (by keypad, digital input or supervisor) while the maximum opening value is unique.
- Maximum percentage variation: the movement of the valve cannot exceed the maximum set percentage variation per second.
- Maximum receiver pressure: a maximum value can be set for the receiver pressure, above which an alarm is triggered and unit operation can be blocked. The block is optional and can be enabled by a parameter.

6.7.2 Summary of inputs, outputs and RPRV valve parameters

The following is a summary table of the inputs/outputs used and the parameters with indications of the related configuration screens. For details, refer to Chapter 6 and Appendix A.1.

Summary of inputs/outputs and RPRV valve parameters

	Mask	Description	
Analog inputs	Bab66, Eia01	RPRV receiver pressure probe	
Digital inputs	Baadf, Eia05	RPRV valve alarm	
Analog outputs	Bad15, Eia07	RPRV valve output	
Digital outputs			
Parameters			
Settings	Eib18	Enable RPRV valve management	
		Regulation setpoint for the CO2 receiver	
		pressure	
Degulation	Fib22	Proportional gain for the proportional + integral	
Regulation	EIDZZ	regulation of the RPRV valve	
		Integral time for the proportional + integral	
		regulation of the RPRV valve	
		Minimum opening of the RPRV valve with the	
		unit OFF	
	Eib19	Minimum opening of the RPRV valve with the	
		unit ON	
	Eib20	Opening of the RPRV valve at start-up during	
		pre-positioning	
		Pre-positioning duration	
		Maximum opening of the RPRV valve	
	Eib21	Maximum variation per second allowed for the	
		RPRV valve output	
Safeties	Eib23	HPV valve safety position	
	Eib24	Enable RPRV valve closure when all compressors	
		on line 1 are off	
		RPRV valve closure delay when all compressors	
		on line 1 are off	
		Receiver high pressure threshold alarm	
		Receiver high pressure differential alarm	
	Fib25	Receiver high pressure alarm delay	
	EIDZO	Receiver high pressure alarm reset type	
		Enable compressor shutoff with receiver high	
		pressure alarm	

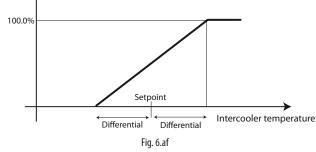

6.8 Intercooler

pRack pR300T manages the gas cooler much the same way as pRack PR300 does for the condensers on a second condenser line, and activation is only available via the Wizard:

Wizard	l b98
Configure in between the lines?	ntercooler suction
	NO

Only temperature control is available. The control variable is therefore the intercooler outlet temperature (measured by the probe, and not a converted pressure value).

Request 🔺

If the intercooler temperature probe is faulty or not fitted, the compressor discharge temperature on the low temperature line (L2) can be used, where configured.

If, on the other hand, the low temperature compressor discharge temperature probe (L2) is not fitted or has an alarm, the controller can use the value converted from the suction pressure on the medium temperature line (L1).

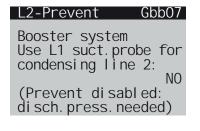

The fans can also be managed with modulating operation by inverter; in this case, there is only one 0 to 10 V modulating output, while a different input can be used for each fan as regards the alarm signal. The function can be enabled and the related parameters set from main menu branch D.b.

The intercooler can be configured only if the second suction line is available (therefore on the pLAN 1 boards, if the double suction line is managed using one board, or pLAN 2 boards if the double suction line is managed using two boards).

The following functions are not available for the second line of fans (intercooler)::

- floating condensing;
- set point compensation;
- chillbooster;
- heat recovery;
- backup pressure probes;
- split condenser.

The pressure prevent function will be managed as configured on screen Gbb07:

Selecting NO means the low temperature line discharge pressure (L2) needs to be configured for managing the PREVENT function, otherwise PREVENT will not be activated.

If the field is set to YES, the PREVENT function will work using the medium temperature line suction pressure (L1).

6.9 Energy saving

pRack PR300T can activate energy saving functions by adjusting the suction and condensing pressure set points. The suction and condensing pressure set points can be applied with two different offsets, one for the closing period and one for the winter period, activated by:

- Digital input
- Time band
- Supervisor

In addition, the suction pressure set point can be modified from analogue input, applying a linearly variable offset based on the value read by a probe. As well as set point compensation from digital input, scheduler, supervisor or analogue input, two further energy saving functions are available, floating suction and condensing pressure set point. The functions can be enabled and the related parameters set in main menu branch C.a.d/C.b.d and D.a.d/D.b.d.

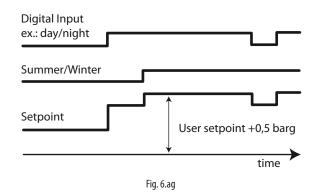

6.9.1 Set point compensation

Compensation from digital input, scheduler or supervisor is similar for suction and condensing pressure set points, consequently the following description applies to both. Two different offsets can be defined, which apply to:

- Closing periods, defined by the scheduler, activation of a digital input or supervisor
- Winter period, defined by the scheduler

The two offsets add to the set point defined by the user when the corresponding condition is active.

Example 1: closing offset 0.3 barg, winter offset 0.2 barg, suction pressure compensation from scheduler and from digital input activated. When the digital input is activated, for example with a day/ night function, 0.3 barg is added to the operating set point, and when the winter period is in progress a further 0.2 barg is added. The operation can be schematised in the following figure:

Note: the same digital input is used for set point compensation on each line, so if suction and condensing pressure set point compensation is activated by digital input, both compensation functions are active at the same time.

If compensation from analogue input is enabled, a offset that is linearly variable to the value read by a dedicated probe can be applied to the suction pressure set point, as shown in the figure.

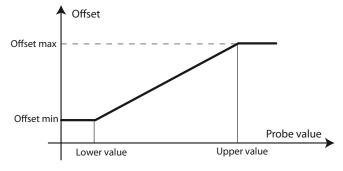

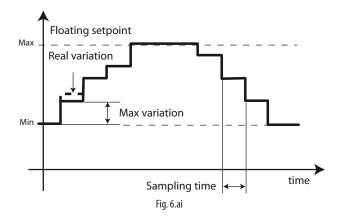

Fig. 6.ah

Compensation from analogue input applies to setpoint:

- suction
- gas cooler
- HPV minimum.
- These compensations can be enabled separately.

6.9.2 Floating suction set point

For the suction line, the floating set point is managed by the supervisor. The suction pressure set point set by the user is changed by the supervisor in range between a settable minimum and maximum. The operation is illustrated in the following figure:

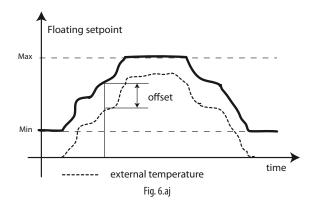

The set point is calculated by the supervisor and acquired by the pRack PR300T controller at set intervals, the maximum variation allowed for the set point in each sampling period can also be set; if the value acquired differs from the previous value by more than the maximum variation allowed, the variation is limited to the maximum value. If the supervisor is disconnected, after 10 minutes (fixed) the pRack PR300T controller starts decreasing the set point with variations equal to the maximum variation allowed each sampling period, until reaching the minimum set point allowed with floating suction pressure.

Note: if set point compensation from scheduler, digital input or supervisor is also active, the offset is added to the minimum and maximum limits for the floating set point.

6.9.3 Floating condensing set point

For the condenser line, the floating set point is based on the outside temperature. The floating condensing pressure set point is achieved by adding a constant programmable value to the outside temperature and limiting the resulting value between a settable minimum and maximum, as shown in the figure:

Note: if set point compensation from scheduler, digital input or supervisor is also active, the offset is added to the minimum and maximum limits for the floating set point.

6.10 Accessory functions

pRack PR300T can manage several accessory functions. Of these, the economizer and liquid injection have already been described in paragraph 6.3 on compressor operation, while the others are described below.

6.11 Oil management

pRack pR300T allows some additional functionalities for oil management, per individual compressor or per line:

· Individual compressor: oil cooling, oil injection.

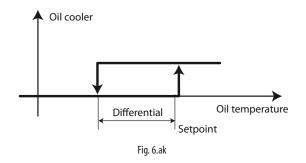

• Line: common oil receiver

The functionalities can be enabled and the relative parameters can be set from main menu branch E.a.a/E.a.b.

6.11.1 Individual compressor oil management

Oil cooler

An oil cooler can be managed for the first 6 compressors in line 1, in order to keep the oil temperature under constant control. For each compressor, based on the value read by the oil temperature probe, an oil cooler digital output can be activated with a settable threshold and differential, as shown in the figure.

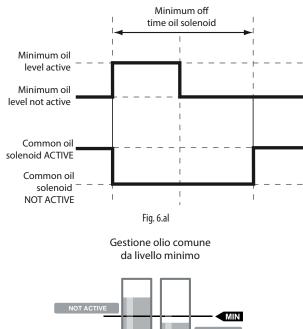

For each compressor, two alarms can also be managed for high or low oil temperature, setting the threshold, differential and delay.

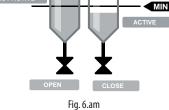

Oil injection

An oil injection valve can be managed for each of the first 6 compressors in each line as shown schematically for three compressors in Fig. 6.ah. Valve activation is performed when the corresponding oil level digital input is active. The valve is opened in intermittent mode with settable opening and closing times, for a total time that is also settable. Once exceeded, if the digital input is still active a low oil alarm is generated. When the oil level digital input is not active, the valve is activated with opening and closing times which can be set at a different value, in order to allow the passage of a certain quantity of oil.

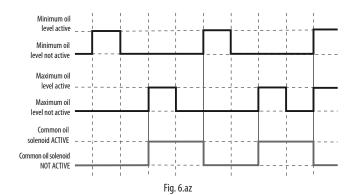

6.11.2 Oil management per line

A solenoid valve can be managed which connects the oil separator to the receiver based on the digital input reading of the oil level, which can be only minimum level or minimum and maximum level. Separator, receiver and valve are illustrated schematically in Fig. 5.a. If no oil level input is present, the solenoid valve can still be activated by connecting its operation to the status of the compressors. If only the minimum level is present, activation of the solenoid valve occurs intermittently for the entire time in which the minimum level is not active. The opening and closing times of the valve during activation can be set by a parameter. If the minimum level signal deactivates again, the valve remains deactivated for at least a minimum set closure time, as shown in the figure:

If two levels are present, activation of the solenoid valve occurs when the maximum level is activated and remains activated in intermittent mode, with settable opening and closing times, for the entire time in which the minimum level is not active. If the minimum level signal is activated, the valve remains deactivated until the maximum level is reactivated again, as shown in the figure:

Gestione olio comune da livello minimo e massimo

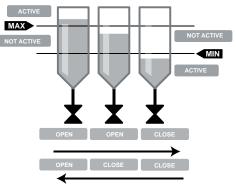

Fig. 6.ba

If no oil level input is present, activation of the solenoid valve occurs intermittently for the entire time in which at least one compressor is active. The opening and closing times of the valve during activation can be set by a parameter. In any case, if the pressure difference between the oil receiver and suction is less than a settable threshold for at least a settable time, the solenoid can be forced in intermittent mode with settable times. It is also possible to set different delay times, to be applied during normal operation, or when the pressure difference exceeds the threshold, in order to ensure pressurization of the receiver.

ENG

Common oil management based on differential pressure

pR300T also offers the possibility to configure an oil receiver pressure probe, directly from the "Inputs/Outputs" menu: Inputs/Outputs → Status → Analog Inputs → Screen Bab63

as well as a digital output for the oil reservoir, again at the same path: Inputs/Outputs → Status → Digital Outputs → Screen Bac71

This will manage the solenoid valve placed between the oil separator and receiver. Once these two I/Os have been enabled, a pressure differential threshold can be set between the oil receiver pressure and the suction line pressure, from the "Other functions" menu:

Other functions → Oil → Settings → Screen Eaab14

If the difference between the two pressure values is less than the threshold, the pR300T will open the pressurising solenoid valve between the separator and receiver. This activation may be delayed by a settable value in seconds. The valve will be closed immediately once the correct difference between the two pressure values has been restored.

6.11.3 Summary of inputs, outputs and oil parameters

The following are summary tables of the inputs/outputs used and the parameters with indications of the related configuration screens. For details, refer to Appendix A.1.

Tab. 6.g

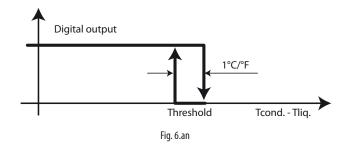

6.12 Subcooling

pRack PR300T can control subcooling in two different ways:

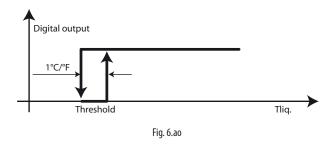

- with the condensing temperature and the liquid temperature
- with the liquid temperature only

In the first case, subcooling is calculated as the difference between the condensing temperature (obtained by converting the condensing pressure) and the liquid temperature measured after the exchanger.

The corresponding output is activated below a set threshold, with fixed differential.

In the second case, the output is active for liquid temperature values greater than a threshold, with fixed differential.

The subcooling function can be enabled and the related parameters set in main menu branch E.b.a/E.b.b.

Note: the subcooling function is active when at least one compressor is on.

6.13 Heat recovery

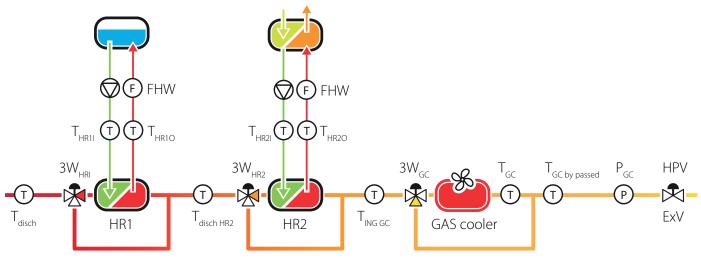

Fig. 6.ap

pRack pR300T manages up to two heat recovery functions at the same time. The related parameters can be set from the main menu, branch E.e.a.b.01.

Activation and control of each heat recovery function will reflect the percentage of heat demand calculated based on one of the following:

- digital input
- temperature probe
- external analogue signal

In the last two cases, a digital input can still be used to enable the function.

Once active, heat recovery control can act on the HPV valve set point and on the effective Gas Cooler set point, in both simultaneous mode (acting on both at the same time) and in sequential mode, based on thresholds (first acting on the HPV and then the Gas Cooler, when exceeding a certain heat demand threshold):

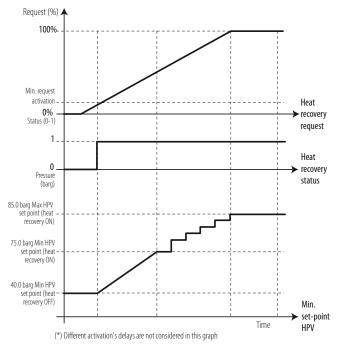

- action on HPV set point (in barg/psig)
- action on GC set point °C/°F)

When acting on the HPV valve set point, the heat recovery function modifies the "Minimum HPV valve control set point" parameter (screen Eib28), whose default value is 40.0 barg and used as a lower limit for calculating the dynamic pressure set point for controlling the high pressure valve.

Increasing this minimum set point from its default value (40.0 barg) to a new minimum set point (e.g. 75.0 barg) causes the system to operate in transcritical conditions, even when the Gas Cooler outlet temperature is between Tmin and T23 (see the control parameters, screen Eib05); in this zone, defined as subcritical, the HPV set point would be calculated based on subcooling.

This minimum set point can be increased further (screen Eeab28) in proportion to the heat recovery demand, up to a settable maximum limit value (e.g. 85.0 barg).

If the HPV valve set point calculated based on the Gas Cooler temperature exceeds the minimum set point modified by the heat recovery function, the controller will use the calculated set point.

When acting on the on the Gas Cooler set point, the Gas Cooler fan temperature set point can be increased gradually to the maximum limit.

This limit is equal to the maximum allowable set point (screen Dab06) when operating in simultaneous mode, or the value set on screen Eeab29 in sequential mode.

In simultaneous mode, the increase will start at the same time as the action on the HPV valve set point, while in sequential mode the increase will start after having exceeded a settable heat demand percentage limit threshold (Eeab29).

If the floating condensing function is active (branch D.a.d), this can be disabled when heat recovery is active (Eeab04), however if it is enabled while heat recovery is active, the Gas Cooler set point increase can be added directly to the outside temperature.

ENG

- CFloating condensing without heat recovery: SP=Tout+ ΔT (screen Dad06)
- Floating condensing during heat recovery (acting on GC): SP=Tout+OffsetGC; where OffsetGC> ΔT
- As the last step of the heat recovery function, the Gas Cooler can be bypassed when the following conditions are true:
- bypass is enabled (screen Eeab)
- the heat demand percentage exceeds a settable limit value (e.g. 90%)
- the bypassed gas temperature cooler is lower than a certain settable limit value (e.g. 20°C)

When these conditions are true, the bypass valve will start modulating, with its set point being calculated based on the bypassed Gas Cooler temperature, until the Gas Cooler is completely bypassed when the temperature allows.

When heat recovery is deactivated, the HPV valve set point gradually returns to the calculated value, over a settable time. The same is also true for the condenser control set point.

6.14 Generic functions

pRack pR300T allows the use of free inputs/outputs and some internal variables for generic functions.

Attention: generic functions are available on the pRack pR300T boards with pLAN address from 1 to 4, or on all boards that manage a suction or condensing line, however only the parameters related to the functions managed by boards 1 and 2 are sent to the supervisor system.

The generic functions available for each board are:

- 5 stages
- 2 modulations
- 2 alarms
- 1 scheduler

Each function can be enabled/disabled by digital input or user interface.

The functionalities can be enabled and the relative parameters can be set from main menu branch E.f.

To be able to use the free inputs they must be configured as generic probes from A to E (analog inputs) and generic inputs from F to J (digital inputs), so a maximum of 5 analog and 5 digital inputs can be used. After having configured the generic probes, the variables associated with them can be used as regulation variables and the digital inputs as enabling variables. Besides the probes and generic inputs, internal variables in the pRack pR300T software can be used, which depend upon the configuration of the system. Some examples, for analog variables, are:

- Suction pressureGas cooler pressure
- Saturated suction temperature
- Gas cooler temperature
- Suction temperature
- Discharge temperature
- % of compressors active
- % of fans active
- Superheating
- Subcooling
- · Liquid temperature
- % requested compressors
- % requested fans

for digital variables:

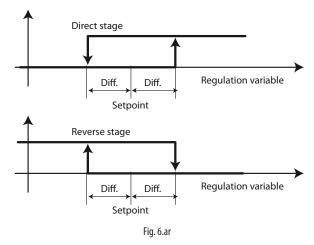

- High suction pressure alarm
- Low suction pressure alarm
- High gas cooler pressure alarm
- Low gas cooler pressure alarm
- Sign of life
- Prevent active

A unit of measure and description can be associated to each generic function. The following shows the operation of 4 types of generic functions.

Stages

pRack pR300T can manage up to 5 stage functions, with either direct or reverse operation.

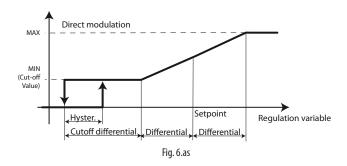

In both cases a setpoint and differential can be set and the operation of the related output is illustrated in the figure for both cases:

If an enabling value is set, the output connected to the stage is active if the enabling is also active. For each stage, a high alarm and low alarm threshold can be enabled and they are absolute. For each alarm, the activation delay and priority can be set. See Chapter 8 for details on the alarms. An example of using the generic stage functions may be the activation of the fans on the room units based on the temperature.

Modulation

pRack pR300T can manage up to 2 modulation functions, with either direct or reverse operation. In both cases a setpoint and differential can be set and the operation of the related output is illustrated in the figure for the direct mode, where the cut-off function is also enabled:

If an enabling value is set, the output connected to the stage is active if the enabling is also active. For each modulation, a high alarm and low alarm threshold can be enabled and they are absolute. For each alarm, the activation delay and priority can be set. See Chapter 8 for details on the alarms. For modulation, a minimum and maximum value can also be set for the output and the cut-off function can be enabled, which operates as shown in the previous figure.

Alarms

pRack pR300T can manage up to 2 alarm functions, for which a digital variable to be monitored, activation delay, priority and any description can be set. A digital output can be associated to each general alarm function for the activation of external devices when the alarm is triggered. One example of use of the generic alarm functions is the detection of gas leaks.

Scheduler

pRack pR300T can manage a generic scheduler which activates a digital output in certain time bands. Up to 4 daily time bands can be set for each day of the week. Operation of the generic scheduler can also be linked to the common scheduler and the output activated based on:

- summer/winter
- up to 5 closing periods
- up to 10 special days

See Paragraph 6.7.2 in the pRack PR300T manual code +0300011EN for details on the time bands.

6.14.1 ChillBooster

pRack PR300T can control the Carel ChillBooster, device used for evaporative cooling of the air that flows through the condenser.

ChillBooster can be enabled and the related parameters set in main menu branch E.g. $% \left({{{\rm{B}}_{\rm{B}}}} \right)$

ChillBooster is activated when two conditions exist:

- the outside temperature exceeds a set threshold
- the fan control request is at the maximum for at least a settable number of minutes

The maximum request time starts counting again whenever the request decreases, therefore the request must remain at the maximum for at least the set time. Activation ends when the request falls below a set threshold.

pRack PR300T can manage an alarm digital input from ChillBooster, the effect of which is to deactivate the device.

As the number of operating hours of ChillBooster is critical as regards formation of scale on the condenser, pRack PR300T can manage the operating hour threshold, which should be set to 200 hours.

Hygiene procedure

To avoid water stagnation in the pipes, a hygiene procedure can be enabled that activates ChillBooster every day for a set time, if the outside temperature is greater than a threshold.

Note: if the outside temperature probe is not configured or is configured but is not working, ChillBooster operates based solely on the control request, and the hygiene procedure can still be activated.

The only difference between probe not configured and probe not working concerns the ChillBooster operating without temperature probe alarm, which is only generated when the probe is configured but not working.

ChillBooster as the first stage in high pressure prevention

ChillBooster can be used to prevent high condensing pressure. The parameters relating to this function can be set in branch G.b.a/G.b.b in the main menu, after having enabled the ChillBooster function. For details on the prevent function see paragraph 8.3.3. Operation of ChillBooster as the first stage in high pressure prevention is Similar to the heat recovery function described in paragraph 6.6.3. The function must be enabled and an offset must be set in relation to the prevent.

6.15 Double line synchronization (DSS)

pRack pR300T can manage some synchronization functions between the two lines:

- Inhibition of contemporary compressor starts
- Forcing the medium temperature line if the low temperature line is activated
- Turning off the low temperature line if the medium temperature line is in a serious alarm condition

The three DSS functions can be enabled independently

Attention: in the pRack pR300T software, it is assumed that the medium temperature line is line L1 while the low temperature line is L2.

DSS can be enabled and the relative parameters can be set from main menu branch E.f.

Inhibition of the contemporary starts

The inhibition of contemporary starts of the compressor can be useful for all system configurations with two separate lines and in cascading system configurations. The function that prevents contemporary starts can be enabled and a delay time can be set for compressor starts belonging to different lines.

Forcing the medium temperature line

Forcing the medium temperature line can be useful for cascading system configuration and, once enabled, can force the startup at minimum power of at least one compressor in the medium temperature L1 line if at least one compressor in the low temperature L2 line is on.

This means that before turning on the low temperature line, the DSS forces at least one of the compressors in the medium temperature L1 line to turn on at minimum power. The low temperature L2 line thus has greater priority in relation to the request coming from the regulation for the medium temperature L1 line.

Turning off the low temperature line

Turning off the low temperature line is forced by the DSS if a serious alarm occurs which turns off all of the alarms in the medium temperature line or, in general, if the medium temperature line is OFF.

Enable pump-down on medium temperature line

During normal compressor rack operation, when at least one compressor on the low temperature line is running, the medium temperature compressor control will enable pump-down. If there is demand, the minimum capacity step will be guaranteed, only if the medium temperature line suction pressure is below a set threshold.

Note: in the event of failure of the pLAN network, the DSS is disabled

6.16 EEVS: Electronic Expansion Valve Synchronization

The new software for managing transcritical systems features the possibility to manage the 2 stepper valves for high pressure and flash gas control directly from the pRack controller. The built-in driver on PRK30TD*** controllers or the external driver (EVD) is controlled via fieldbus. Direct communication between controller and driver is used to synchronise compressor rack operation and electronic expansion valve control.

Communication is managed inside the controller (on PRK30TD*** codes) or via RS485 serial for external drivers. One single interface (pRack) can thus be used to monitor / set the main parameters for the EVDEVO and view them via the supervisor (Modbus communication). The FIELDBUS DRIVER offers the possibility to use 4 additional analogue inputs (S1, S2, S3 and S4) directly from pRack.

- Where:
- S1 Probe 1 (pressure) or external 4 to 20 mA signal
- S2 Probe 2 (temperature) or external 0 to 10 V signal (*)
- S3 Probe 3 (pressure)
- S4 Probe 4 (temperature)

6.16.1 HPV and RPRV valve connection

The HPV and RPRV valves can be connected:

directly, controlling the valves using a 0-10 V output on pRack pR300T

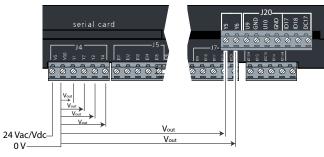

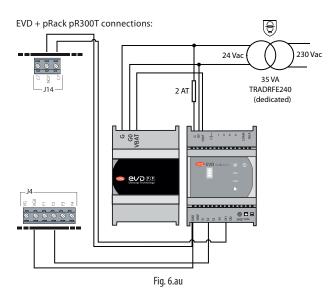

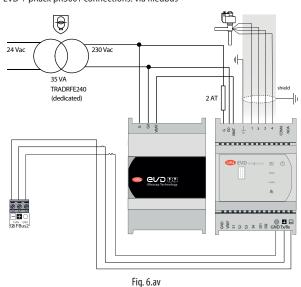

Fig. 6.at

(*): If one of the two valves is controlled by the driver Carel, while the other, just is controlled by a signal 0...10V, remember to disable the last one from the driver with mask Ib99 during Wizard operation or mask Eic01 if Wizard is completed.

• via an EVD EVO driver configured as 0 to 10 V positioner to control Carel stepper valves (pressure less than 45 barg) or third party valves (fig. 2.f)

 via a EVD EVO external driver (fig. 2.g) or integrated in PRK30TD*** models, in both cases using fieldbus serial.

6.16.2 Unit of measure pRack PR300T can manage two units of measure, the international system and Imperial.

Note: the temperature and pressure units of measure can be changed from °C, barg to °F, psig only during start-up; mixed configurations are not allowed, for example °F and barg.

6.16.3 Sign of life

pRack PR300T can manage a digital output acting as a sign of life, activated when pRack PR300T is powered up. This output remains active while the controller is working correctly and highlights any hardware faults. The Signal can be configured in main menu branch B.a.c.

6.16.4 Liquid non-return

pRack PR300T can manage a digital output with the meaning of liquid non-return. This normally active output is deactivated when all the compressors are off and no compressor can be started due to alarms or time settings, despite the control request, or when the unit is OFF. As soon as at least one compressor is enabled to start, the output is deactivated, allowing management of a liquid non-return valve. The function can be configured in main menu branch C.a.g/C.b.g.

6.16.5 Parallel compressor

pRack pR300T can enable a line of compressors in parallel to the medium temperature suction line upstream of the RPRV valve using a dedicated board, and starting from version 3.3.0 this board can be enabled via pLAN. If managing a single parallel compressor (again starting from version 3.3.0), the main control board can be used, i.e. without requiring a dedicated board.

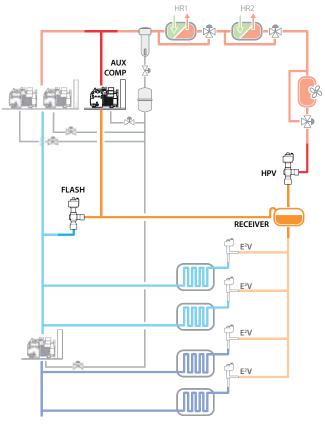

Fig. 6.aw

This function is configured in branch COMPRESSORS \rightarrow c.Parallel compress.

Со	mpressor	rs <u>3/3 =</u>
	Line 1	
b.	Line 2	
C.	Parallel	compressi on

If the parallel compressor line is managed using an additional board (via pLAN or connected via DI/DO):

Parallel Compr. Cca	a01
Enable parallel compressor:	YES
Control mode: EXTERNAL P	PLAN
Parallel Compr. Cc	:a01
Enable parallel	YES
Control mode: EXTERNAL	1/0

in both cases, the board follows the configuration and relative restrictions described in the paragraphs on control 6.3 and compressors 6.4.

EVD + pRack pR300T connections: via filedbus

Consequently, the first compressor in the parallel line can be controlled by inverter. It is recommended to use a suction pressure set point value for the parallel line that is the same as the receiver pressure set point for proportional control, while the set point should be slightly lower than the latter for neutral zone control (1 barg difference between the two set points should be sufficient).

If on the other hand there is a single parallel compressor managed directly by the main board:

Compressor control is proportional with integration error, P+I, and the various settings, relating to:

- times;
- control;
- inverter modulation;
- alarms;
- analogue output configuration;

can all be found inside the same menu: C.Compressors \rightarrow c.Parallel compression \rightarrow Ccaxy (see the parameter table)

The main variables used to manage activation and control of the parallel compressor are:

- gas cooler outlet temperature;
- RPRV valve opening percentage;
- receiver pressure set point.

The parallel compressor is activated when the following conditions are true:

- gas cooler outlet temperature above a settable threshold;
- RPRV valve opening percentage above a settable threshold.

At the same time as the parallel compressor is activated, the receiver pressure set point will be increased by a settable offset in a settable time.

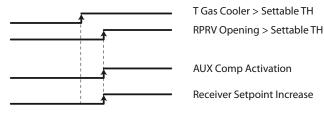

Fig. 6.ax

Increasing the receiver set point results in the flash gas valve (RPRV) closing. The parallel compressor is not affected by a decrease in the opening of the RPRV valve, however remains active until parallel compressor control reaches the set point (depending on how the controller is configured)

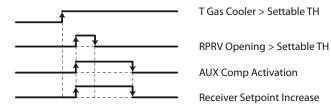

Fig. 6.ay

If, on the other hand, the Gas Cooler outlet temperature falls below the activation threshold, the card that manages the parallel compressor no longer receives the enabling signal and thus switches off the parallel compressor:

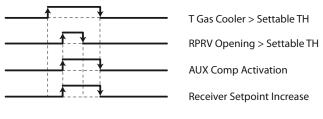

Fig. 6.az

Oil differential management with parallel compression The parallel compression function, either integrated (single compressor) or via pLAN, can also be included in the common oil management by differential pressure (also see paragraph 6.10.2), and is enabled on screen Eaab25:

Oil Set.	Eaab25
Dil press.M	Nana9ement
Enable oil	press.diff.
mana9ement:	YES

Differential oil pressure control by dedicated pressure probe, screen Eeaa1a:

AI Status	Eeaala
Oil reserve PLB1 U5	Pressure 4-20mA
	barg
Upper value:	
Lower value:	0.0bar9
Calibration:	0.0bar9

This manages the opening of the solenoid valve, screen Bac71.

<u>DO Status</u>	Bac71
Dil reserve PLB []1	D0 🔝
Status Logic	CLOSE
Function 🛛	Active

This digital output is dedicated to the common solenoid valve installed between the oil separator and oil receiver.

When the oil reservoir pressure approaches the threshold (delta) set on screen Eaab14:

Oil Set.	Eaab14
Dil receiver	settin9s
Threshold:	2.0bar9
Differential:	0.5bar9
Delay:	30s

This will trigger the opening of the valve so as to pressurise the oil reservoir and ensure correct oil flow to the compressors.

The delta is calculated based on the difference between the medium temperature compressor suction pressure and the oil receiver pressure. The status of the function can be checked on screen Aa61:

<u>Main info</u>	Aa61
Suction Suct.pres.:	barg
Oil press.: Delta:	-11.2bar9 -1.3bar9
Act.setp.: Diff.:	2.0bar9 0.5bar9
Status:	YES

pRack PR300T +0300018EN rel. 1.5 - 02.05.2017

For integrated parallel compression (single compressor), when the parallel compressor is active, the reference for calculating the delta will no longer be more the medium temperature line compressor suction pressure, but rather the (liquid) receiver pressure, which coincides with the parallel compressor suction pressure

The changeover in reference from suction to receiver pressure is automatic, and does not need to be enabled.

For parallel compression enabled via pLAN, the same I/Os (oil receiver pressure probe and solenoid valve digital output) and the same settings (delta and differential) can be used as seen above, or new I/Os and new parameters can be set on the parallel compressor board (always on screen Eaab25)

6.17 Settings

6.17.1 Clock

pRack PR300T features an internal clock with backup battery that keeps the time and date for all related functions (see Chapter 2 for details relating to the hardware).

The date on pRack PR300T can be set as follows:

- day, month, year (dd/mm/yy)
- month, day, year (mm/dd/yy)
- year, month, day (yy/mm/dd)

The current date and time can be set, the day of the week corresponding to set date displayed, plus changeover to daylight saving can be enabled by setting the changeover date and the deviation.

The related parameters can be set during start-up or in main menu branch Fa

Note: the date and time are managed on pRack boards with addresses 1 and 2; on power-up and whenever the pLAN network is reconnected, the software on pRack synchronises the settings on board 2, sending the date and time set on board 1.

If the clock card is not operating, an alarm is generated and the functions relating to the time bands described in the following paragraph are not available.

6.17.2 Time bands

pRack PR300T allows the operating seasons, the closing periods and weekends to only be set once, and consequently these are common to all the system functions.

As well as these settings, each function can be associated with a weekly scheduler, setting up to 4 different daily activation bands for each day of the week. For each time band, the start and end time can be set and settings made can be copied to the others days of the week.

The priority of the schedulers, from lowest to highest, is:

- weekly scheduler
- · closing periods
- special days

For example, if the weekly scheduler requires activation of a function, yet a closing period is in progress, and requires deactivation of the same function, then the function is deactivated.

The following functions allow the setting of time bands:

- Split-condenser: the function is active only based on the operating seasons, and consequently special days, closing periods and daily time bands are ignored.
- Silencer: the function is only active with daily time bands, there is no link to operating seasons, special days and closing periods
- Heat recovery: the function is active with daily time bands, special days and closing periods, no link to operating seasons. The link to the general scheduler can be disabilitato, considering the time bands only.
- Set point compensation: active with operating seasons, special days, closing periods and daily time bands (two different offsets).
- Generic functions: the generic scheduling function is active with the operating seasons, special days, closing periods and daily time bands. Operation of the generic functions can be separated from the generic scheduler, considering the daily time bands only.

For details on the functions that use time bands, see the corresponding paragraphs.

6.18 Managing the default values

pRack PR300T can manage two different sets of default values: • user defaults

- · Carel defaults
- The two functions can be activated in main menu branch I.d.

Important: after having reset the default values, the pRack PR300T board need to be switched off and on again.

6.18.1 Saving and resetting the user default values

pRack PR300T can save the exact configuration set by the user inside the instrument, allowing it to be recalled at any time.

All the set values are saved, therefore loading user defaults restores the exact same conditions that the pRack PR300T controller was in when the data were saved.

Note: only one user default configuration can be saved, therefore when the data is next saved, this overwrites the previous data.

Important:

- · the Carel default reset procedure totally deletes the pRack PR300T permanent memory, and consequently is an irreversible operation;
- the user values cannot be reset after updating the software on the pRack PR300T (see Chapter 10).

6.18.2 Resetting the Carel default values

The Carel default values are shown in the Parameters table.

The values pre-set by Carel can be installed at any time, restoring the pRack PR300T default settings, and requiring the startup procedure described in Chapter 4 to be repeated.

Important: the Carel default reset procedure totally deletes the PRack PR300T permanent memory, and consequently is an irreversible operation; nonetheless, the user settings can still be restored if these have already been saved. Given that pRack PR300T, following the installation of the Carel default values requires the startup procedure to be repeated, select the first pre-configuration and then restore the user defaults.

Note: to complete a new configuration procedure (reffer to Chapter 4), first restore the Carel default values.

7. PARAMETERS AND ALARMS TABLE

7.1 Parameter table

"Mask index": indicates the unique address of each screen and therefore the path for reaching the parameters in that screen. For example, to reach the parameters related to the suction pressure probe with mask index Bab01, proceed as follows:

🤝💻 Main Menù 🔟 B. I n. ∕Out. →a. Status→b. Anal og. i n.

Below is the table of parameters that can be displayed on the terminal.

The values indicated with '---' are not significant or are not set, while the values indicated with '...' may vary according to the configuration and the possible options are visible on the user terminal. A line of '...' means that there are a series of parameters similar to the previous ones.

Note: not all of the screens and parameters in the table are always visible/settable, the visible/settable screens and parameters depend upon the configuration and access level.

7.2 Alarm table

pRack pR300T can manage both alarms relating to the status of the digital inputs and to system operation, similar to the pRack pR300. For each alarm, the following are controlled:

- The actions on the devices, if necessary
- The output relays (one global and two with different priorities, if configured)
- The red LED on the terminal and the buzzer, where present
- The type of acknowledgement (automatic, manual, semiautomatic)
- Any activation delay

The complete list of alarms for the pRack pR300T with the related information as described above, is reported below.

ALARMS 8.

pRack PR300T can manage both alarms relating to the status of the digital inputs and to operation of the system. For each alarm, the following are controlled.

- The actions on the devices, if necessary
- The output relays (one global and two with different priorities, if configured)
- The red LED on the terminal and the buzzer, where present
- The type of acknowledgement (automatic, manual, semiautomatic) • Any activation delay

The complete list of alarms, with the related information as described above, is available in Alarm table.

Alarm management 8.1

- All alarms feature the following behaviour:
- · When an alarm is activated, the red LED flashes and the buzzer is activated (where present); the output relays corresponding to the global alarm and to any alarms with priority are activated (if configured)
- Pressing the \mathbf{A} (Alarm) button, the red LED stays on steady, the buzzer is muted and the alarm screen is shown
- If there is more than one active alarm, these can be scrolled using m au(Up) \checkmark (Down). This condition is signalled by an arrow at the bottom right of the screen
- Pressing the $oldsymbol{A}$ (Alarm) button again for at least 3 seconds acknowledges the alarms manually, and these are cleared from the display unless others are active (they are saved in the log)

8.1.1 Priority

For certain alarms, the alarm output relay can be set with two types of priority:

- R1: serious alarm
- R2· normal alarm

The corresponding relays, once configured, are activated when an alarm with the corresponding priority occurs. For the other alarms, the priority is fixed and is associated by default with one of the two relays.

8.1.2 Acknowledgement

The alarms can have manual, automatic or semiautomatic acknowledgement:

- Manual: the alarm is acknowledged by pressing the \mathbf{A} (Alarm) button twice, the first time displays the corresponding alarm screen and mutes the buzzer, the second (extended, for at least 3 seconds) cancels the alarm (which is saved in the log). If the alarm is still active, acknowledgement has no effect and the signal is shown again.
- Automatic: when the alarm condition ceases, the alarm is automatically reset, the LED comes on steady and the corresponding screen remains displayed until the lacksquare (Alarm) button is pressed and held; the alarm is saved in the log.
- Semiautomatic: acknowledgement is automatic, until a maximum number of activations in set time. If the number reaches the maximum set, acknowledgement becomes manual.

For manual acknowledgement, the functions associated with the alarm are not reactivated until acknowledgement has been completed, while for automatic acknowledgement they're reactivated as soon as the alarm condition ceases.

8.1.3 Log

The alarm log can be accessed:

- from branch G.a of the main menu
- by pressing the ▲ (Alarm) button and then ← (Enter) when there are no active alarms
- by pressing ← (Enter) after having scrolled all the alarms.

The alarm log screens show:

- 1. Order of activation (no. 01 is the oldest alarm)
- 2. Hour and date the alarm was activated
- 3. Short description
- 4. Main values recorded at the moment the alarm was activated (suction pressure and condensing pressure).

Note: A maximum of 50 alarms can be logged; after this limit any new events overwrite the oldest ones, which are therefore deleted.

8.2 Compressor alarms

The number of alarms for each compressor can be set during the configuration phase using the Wizard or subsequently from branch C.a.e/ C.b.e of the main menu. The number of alarms is the same for all the compressors on the same line.

Alarms cae01
NUMber of alarms
for each compressor:
З
Fig. 8.a

Note: The maximum number of alarms that can be configured for each compressor depends not only on the type of compressor, but also on the size of pRack and the number of compressors fitted.

After having selected the number of alarms (maximum 4), the settings can be configured for each alarm, choosing a description from the options shown in the table, the output relay, the type of reset, delay and priority. The effect of the alarm on the devices is set and involves stopping the compressor, except for the oil warning.

Possible descriptions for compressor alarms

Reciprocating or scroll	
Generic	
Overload	
High pressure	
Low pressure	
Oil	
	Tab. 8.a

An example of a screen for selecting the description of the alarm is shown in the figure:

Alarms		caeøz
Alarm	1 descrip	Ption:
		_
generi	C:	•
over10	ad:	
Hi9h P	ressure:	
LOW Pr	essure:	
Oil:		

Fig. 8.b

After having selected the 'generic' description, no other description can be selected. In general, the descriptions are divided in:

- overload,
- oil,
- high pressure
- low pressure.

After a description has been selected for a certain group, descriptions from a different group can not be selected for that alarm. For example, generic only, or overload + oil, or rotation only or overload + high pressure., etc. can be selected. Each alarm will have one alarm screen, which will show all the descriptions associated to that alarm.

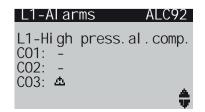

Starting from version 3.3.0, the main alarms relating to the compressors have been grouped together; specifically, the alarms can be configured in the path: C.Compressors \rightarrow d.Alarms \rightarrow Cae01 (Fig.8.a). The screens show which compressors (only those configured) will be shutdown (and which not) when a specific alarm is activated (generic alarm, high pressure..); for example, with 3 compressors and the first 2 with alarms, the following will occur:

According to the number of alarms selected, the default associated descriptions will be as shown in the table.

L1-Alarms	ALC90
L1-Generic C01: 血 C02: 血 C03: -	alarm comp.

Further example:

The same applies to the following alarms:

- L1 Compressors overload alarm
- L1 Compressors high pressure
- L1 Compressors low pressure
- L1 Compressors oil alarm
- L2 Compressors generic alarm
- L2 Compressors overload alarm
- L2 Compressors high pressure
 L2 Compressors low pressure
- L2 Compressors oil alarm

Default descriptions based on the number of alarms

Number of alarms	Descriptions	
1	Generic	
2	Overload	
2	HP-LP	
	Overload	
3	HP-LP	
	Oil	
	Overload	
1	HP	
4	LP	
	Oil	
	Ta	h 8 h

Note: for oil alarms, special management is available whereby the alarm is interpreted as an oil level alarm. When the alarm is activated, a number of attempts are made to restore the level for a set time before the alarm is signalled and the compressor stopped.

If a modulating device is used for the compressors, further alarms become available:

- compressor inverter warning, common for the entire suction line, when the device is an inverter
- oil sump temperature alarm, high discharge temperature and oil dilution, for Digital Scroll™ compressors

For each compressor, two alarm variables are sent to the supervisor, one for each priority. As well as the alarm signal, the description of the alarm is also sent to the supervisor, using the values shown in the table:

The supervisor can interpret the variables sent by pRack PR300T and provide the correct description of the alarm.

8.3 Pressure and prevent alarms

pRack PR300T can manage pressure alarms from a pressure switch or probe, according to the following diagram.

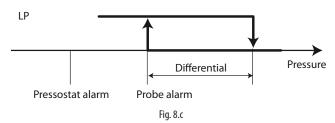

Alarms from pressure switch:

- Low suction pressure
- High condensing pressure

Alarms from probe:

- Low suction pressure
- High suction pressure
- Low condensing pressure
- High condensing pressure

One possible example for the low pressure alarms is shown in the figure:

In addition, the high pressure alarm features a prevent function, available by manually overriding the devices as well as using additional functions, such as heat recovery and ChillBooster. Operation of the alarms and prevent function is described below.

8.3.1 Pressure alarms from pressure switch

The parameters corresponding to these alarms can be set in branch G.c.a/G.c.b of the main menu.

Low suction pressure from pressure switch

The low suction pressure alarm from pressure switch has the effect of stopping all the compressors without observing the various times, therefore when the digital input configured as low pressure switch is activated, all the compressors on the line affected are stopped immediately.

This alarm features semiautomatic reset, and both the monitoring time and the number of activations in the specified period can be set. If the number of activations is higher, reset becomes manual.

In addition, the delay after which the alarm is activated on both start-up and during operation can be set.

The delay at start-up only applies to unit start-up and not compressor power-up.

High condensing pressure from pressure switch

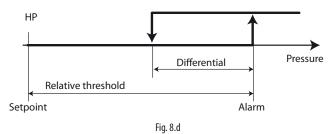

The high condensing pressure alarm from pressure switch has the effect of stopping all the compressors without observing the various times and forcing the fans on at maximum speed, therefore when the digital input configured as high pressure switch is activated, all the compressors on the line affected are stopped immediately and the fans operate at maximum output.

This alarm features manual or automatic reset, as configured by the user. The delay after which the alarm is activated can also be set

8.3.2 Pressure alarms from probe

The parameters corresponding to these alarms can be set in branch C.a.e/C.b.e of the main menu for the suction pressure and D.a.e/D.b.e for the condensing pressure.

For these types of alarms, reset is automatic and the activation threshold and differential can be set, as well as the type of threshold, which may be absolute or relative to the control set point. The figure shows an example of setting the threshold to relative.

Note: for temperature control, the alarms from probe are managed based on temperature even when pressure probes are fitted.

The effects of the different pressure alarms from probe are described below.

Low suction pressure from probe

The low suction pressure alarm from probe has the effect of stopping all the compressors, ignoring the times.

High suction pressure from probe

The high suction pressure alarm from probe has the effect of forcing all the compressors on, ignoring the control times, but observing the compressor protection times.

Low condensing pressure from probe

The low condensing pressure alarm from probe has the effect of stopping all the fans, ignoring the times.

High condensing pressure from probe

The high condensing pressure alarm from probe has the effect of forcing all the fans on and stopping all the compressors, ignoring the times. The reference for the alarm will be the discharge pressure probe (Bab75 or Bbb75), or if this is not configured, the gas cooler / intercooler pressure probe (Bab04 and Dba39).

8.3.3 High pressure prevention

pRack PR300T can manage 3 types of high condensing pressure prevention actions, involving:

- · overriding the compressors and fans
- activating heat recovery
- activating ChillBooster

Prevent by overriding the compressors and fans

The parameters relating to this function can be set in branch G.b.a/G.b.b of the main menu.

The effect of this type of prevent action is to force all the fans on at maximum and switch all the compressors off, except for the minimum capacity stage, ignoring the control times but observing the compressor protection times. The minimum capacity stage means one compressor in the case of compressors without capacity control and modulation devices, or the minimum capacity stage for capacity-controlled compressors (e.g. 25%), or alternatively the minimum output of the modulation device in the case of inverters, Digital Scroll[™].

As well as the activation threshold, which is always absolute, and the activation differential, a compressor deactivation time can be set, corresponding to the time needed to switch off all the compressors, except for the minimum capacity stage.

In addition, both the monitoring time and the number of activations in the specified period can be set. If the number of activations is higher, reset becomes manual.

Prevent by activating heat recovery

The parameters corresponding to this function can be set in branch G.b.a/G.b.b of the main menu, if the heat recovery function is present.

As well as enabling the function, an offset from the activation threshold for the prevent by overriding devices function must be set. The activation differential for this function is the same as set for the prevent by overriding devices function.

When reaching the threshold, pRack PR300T activates the heat recovery function, if the conditions allow.

Prevent by activating ChillBooster

The parameters relating to this function can be set in branch G.b.a/G.b.b of the main menu, if the ChillBooster function is present.

As well as enabling the function, an offset from the activation threshold for the prevent by overriding devices function must be set. The activation differential for this function is the same as set for the prevent by overriding devices function.

When reaching the threshold, pRack PR300T force activates the ChillBooster, if the conditions allow.

The following figure illustrates the activation thresholds for the prevent function and the safety devices:

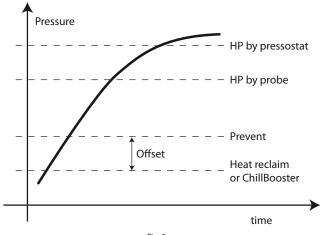

Fig. 8.e

F)

9. SUPERVISORY AND COMMISSIONING SYSTEMS

pRack PR300T can be connected to various supervisory systems, specifically the Carel and Modbus communication protocols can be used. For the Carel protocol, the PlantVisor PRO and PlantWatch PRO models are available. In addition, pRack PR300T can be connected to the pRack Manager commissioning software.

9.1 PlantVisor PRO and PlantWatch PRO supervisory systems

Connection to Carel PlantVisor PRO and PlantWatch PRO supervisor systems uses the RS485 card already fitted on some models of pRack PR300T. For details on the models of card available, see Chapter 1.

Note: In general, the pRack boards that manage the suction lines must be fitted with the supervisor connection card, consequently boards with pLAN address 1 or 2.

Three different models of PlantVisor PRO and PlantWatch PRO are available, used to supervise system configurations with one or two lines:

- L1 one line: can be used for system configurations with just one suction and/or condenser line.
- L2 one line: can be used for system configurations with two suction and/or condenser lines, and the two suction lines are managed by separate boards.
- Two lines: can be used for system configurations with two suction and/ or condenser lines, and the two suction lines are managed by the same board.

Important: model L2 – One line must be used only in association with model L1 – One line. For supervision of system configurations with just one line only model L1 – One line can be used.

Tutorial: the rule applied for using the models is summarised below:

• cconfiguration with board with pLAN address $2 \rightarrow$ separate models

• configuration without board with pLAN address 2 \rightarrow one model only

A connection example for using PlantVisor PRO and PlantWatch PRO is shown in the figure.

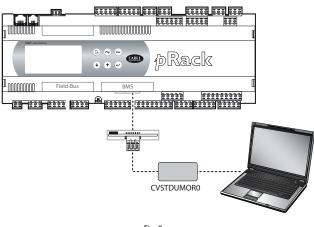

Fig. 9.a

The complete list of supervisor variables, with the corresponding addresses and descriptions, can be supplied upon request.

9.2 Commissioning software

pRack Manager is configuration and real-time monitoring software used to check the operation of pRack PR300T, for commissioning, debug and maintenance operations.

The software is available on the internet at http://ksa.CAREL.com in the section "download à support à software utilities".The installation includes, in addition to the program, the user manual and the necessary drivers.

pRack Manager can be used to set the configuration parameters, modify the values of volatile and permanent variables, save graphs of the main system values to file, manually manage the unit I/Os using simulation files and monitor/reset alarms on the unit where the device is installed.

pRack PR300T is able to virtualise all the inputs and outputs, both digital and analogue, therefore each input and output can be overridden by pRack Manager.

pRack Manager manages <file name>.DEV files that contain the user parameter configurations and that can be downloaded from the pRack PR300T board and then subsequently uploaded.

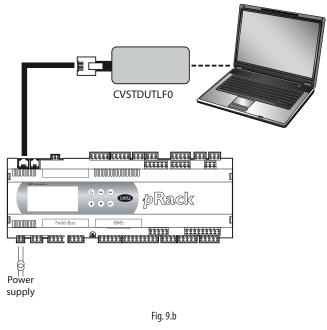

To use the pRack Manager program, a serial converter output RS485 with CVSTDUTLF0 (telephone connector) or CVSTDUMOR0 (3 pin terminal) must be connected to the board.

The connection to pRack Manager can be made:

- 1. Via the RS485 serial port used for the "pLAN" connection
- Via the BMS serial port with RS485 serial card and activating the pRack Manager protocol by parameter on screen Fca01 or connecting pRack Manager and selecting SearchDevice = Auto (BMS or FB) on the "Connection settings" tab. In this case, the connection is established after around 15-20 seconds.

Important: the BMS serial port should only be used for monitoring the variables, while to update the software use the RS485 serial port dedicated to the pLAN connection.

The following figure shows an example of connection to the PC via the RS485 serial port used for the "pLAN" connection

Note: for further details see the pRack Manager program online help.

10.1 Smart Key: operating instructions

Programming the Smart Key via Personal Computer

The operating modes described in the table below can be configured using a program on the PC. The program can also load the software to the key or transfer logged data from the controller to disk.

		Mode button	
В	Update software from key to pRack (BIOS, application, parameters, etc.)	Disabled	
D	(BIOS, application, parameters, etc.)	Disabled	
C*	Copy software from pRack to pRack	Switches the key from write	
C.	(BIOS, application, parameters, etc.)	mode to read mode	
*: Defa	ault mode	L	

Tab. 10.a

The key is factory-programmed in read/write mode (type C) so that it can be used immediately to transfer software from one controller to another. When the key is connected to the personal computer, the symbols have the following meanings:

```
Flashing Waiting for connection to PC
```

Alternating When connected to PC indicates data transfer in progress

The programming key is compatible starting from BIOS version 3.43 and BOOT version 3.01. For more detailed information on programming the key, see the pRack Manager program manual.

Using the Smart Key with the pRack

Switch off the pRack, remove any peripherals connected in the pLAN and plug the key into the telephone connector on the controller. When switching on again, all the symbols light up momentarily and the buzzer emits a beep. A few seconds later the key becomes operational. During this period the symbols \clubsuit will flash. The controller then enters programming mode and the start button lights up steadily. Press the button to start data transfer.

Important: If the key is type B or C pressing the start button will immediately delete the software already loaded on the pRack.

Important: Do not remove the key while data is being transferred to the key itself, as the file being transferred will be lost and the corresponding space will not be restored. To restore the original capacity all the files will need to be deleted. If the key is type "C", simply perform a new application read operation.

Meanings of Buttons/Symbols

5	*
★ ↓	Flashing: The key is connecting to the pRack. During this phase, which may last a few seconds, the start button is disabled.
start	Flashing: The key has detected the pRack and is checking the
	access rights.
	On steady: Pressing the start button will start writing the
start + 🕇	software to the pRack.
start + 🖊	On steady: Pressing the start button will start reading the
Start +	software from the pRack.
	On steady: Pressing the start button will start reading the logs
start + 💷	from the pRack.
mode	On steady: In case of C, pressing the button for 1 second
moue	switches from read to write.

Tab. 10.b

If the key is type C, pressing the "mode" button for 1 second switches from read to write. The symbols ↑ (write to pRack), ↓ (read from pRack), (read logs) reflect the selected status. If the key is not type "C", the "mode" button is disabled and off. The "start" button starts the read or write operation, indicated by the flashing of the corresponding symbol (↑ or ↓) at a frequency proportional to the progress of the operation. When the operation is completed, the buzzer will sound intermittently for 2 seconds. Pressing the "start" button again will make the buzzer sound without repeating the operation. To repeat the operation, the key must first be unplugged. In case of error the symbol will light up together with the other LEDs. The following table can help you find the cause of the problem.

Errors before pressing the START button

<u>↑</u> +++	Symbols flashing	Communication error: No response from the pRack <u>or:</u> Key firmware version is incompatible.
+mode	Symbols steady	Password error
+mode	Symbols flashing	Type of key is incompatible.
<u>↓</u> + ★	Symbols steady	The key is missing one or more required files (memory empty; no kit for the type of pRack connected).
+ + +start	Symbols steady + flashing start	Incompatibility between the software on the key and the pRack HW.
+ + mode	Symbols steady + flashing mode	Incompatibility between pRack application and HW (application size).
<u>+</u> ++	Symbols steady	No logged data present on the pRack.
\triangle	Steady	Type of key not programmed.
		T 40

Tab. 10.c

Errors after pressing the START button

+start+ +buzzer	Symbols flashing and buzzer sounding intermittently	Write operation failed.
+start+ +buzzer	Symbols flashing and buzzer sounding intermittently	Read operation failed.
+start+ +buzzer	Symbols flashing and buzzer sounding intermittently	Read logs operation failed.
<u> </u> +	Symbols steady + 🗎 flashing	Incompatibility between log configuration and pRack HW (no dedicated flash memory). This error does not prevent writing other files.
	Steady	Insufficient space to read logs.
\triangle	Flashing	Generic error

Tab. 10.d

10.2 pRack Manager: operating instructions

pRack Manager is a program that lets you manage all the configuration, debugging and maintenance operations on CAREL pRack devices. pRack Manager can be installed by itself or as part of the 1Tool programming environment.

Installing pRack Manager

On http://ksa.carel.com, under the section "software & support/ Configuration & updating software/parametric controller software", select pRack_manager. After having selected the most recent version of the tool, click "download" and accept the general terms and conditions for the free software user license; the program can then be installed on the computer.

Connecting the PC to the pRack

Connect a cable with USB/RS485 converter to the USB port on the computer, and connect the converter to a telephone cable plugged into the pLAN port of the pRack. Additional connection methods are described in par. 6.5.

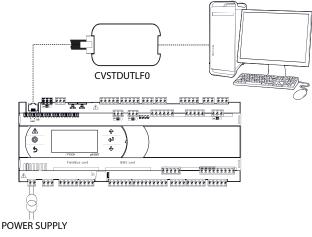

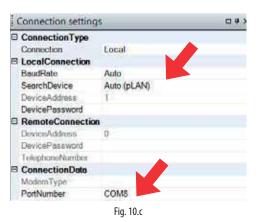

Fig. 10.b

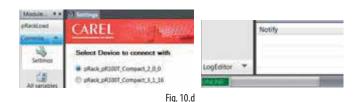

Upon launching, pRack_manager will display a screen showing the connection settings in the upper right-hand corner. Choose: 1) "connessione locale" [local connection]

- 2) baud rate: Auto
- 3) "ricerca dispositivo" [find device]: Auto (pLAN)

As for the port number, follow the Wizard's instructions for the port to be identified automatically (e.g. COM4).

Switch the controller off and then on again and use the Connect command to establish the connection. When the connection is established the flashing message "ONLINE" will appear at the bottom left of the screen.

10.2.1 IInstalling the application to update the software

Select the directory containing the application program files and click "Upload" to upload the program to the pRack controller.

CAREL

10.2.2 Commissioning

Using the mouse, select "Commissioning" at the bottom left. A new work

Click on "configura dispositivo" [configure device] to display all the application variables. The variables can be selected according to the categories that appear at the bottom.

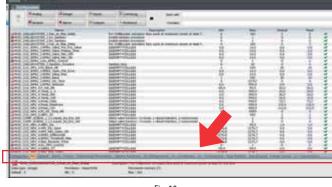

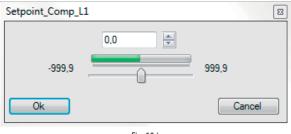

Fig. 10.g

10.2.3 Changing a parameter

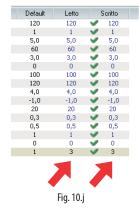

Select the parameter category and then the parameter that you want to edit. The parameter (e.g. recovery.recovery_type) will be highlighted in blue.

1. Double-click on the column marked "letto" [read]. A window will appear in which you can enter the new value for the parameter.

2. Enter the new value (e.g. 3) and click OK. The new value will appear in the column marked "scritto" [written]. To write the parameter to the pRack controller, right-click and select "scrivi selezionate" [write selected]. The new value will appear in the column marked "scritto" [written], meaning that the parameter has been written to the controller.

Click on "Salva" [Save] to generate the project's ".2cw" file.

10.2.4 Commissioning: basic concepts

Note: The following paragraphs are from the online help of pRack Manager, to which the user is referred for further details.

Commissioning is a configuring and real-time monitoring software that can be used to supervise the performance of an application program installed on a pRack, to start up the pRack and to perform debugging and maintenance.

Operators using Commissioning for maintenance will be able to see the necessary variables and to draw from preset configuration values.

10.2.5 Support files

Once the design of the application is completed, 1Tool generates a number of files in the compiling stage, two of which are required by Commissioning:

- <nomeApplicativo>.2CF [<ApplicationName>.2CF] (variable descriptor)
- <nomeApplicativo>.2CD [<ApplicationName>.2CD] (category and access profile descriptor)

In addition to these files, the software also manages the <nome applicativo>.DEV [<Application Name>.DEV] file, which contains the unit's preset parameters.

When the user has finished using Commissioning, whether for configuration or monitoring purposes, the following files can be generated:

- <nomeApplicativo>.2CW [<ApplicationName>.2CW] (descriptor for categories, access profiles, monitoring groups)
- <nomefileCommissioningLog>.CSV [<FilenameCommissioningLog>. CSV] (file used for the commissioning log, containing data of the variables logged during monitoring)

Therefore, to configure Commissioning the following files are required:.2CF, 2CD and, if necessary, the.DEV file, which can be imported or exported. For monitoring purposes, in addition to the files above, it might also be necessary to have the.2CW file, containing the definition of the work environment. The commissioning log file is a simple output file.

10.2.6 pRack Load: basic concepts

pRackLoad is the module that manages:

- uploading to the flash memory (of the device or of the ProgKeyX key installed on the pRack);
- uploading to the NAND memory of certain devices;
- downloading the log file, DEV file and P memory (from the flash memory);
- downloading files from the NAND memory, if present.

The files exchanged with the Flash memories of pRack controllers are:

BOOT.BIN (download reserved, upload enabled from menu)

- BIOS.BIN (download reserved)
- <nomeApplicativo>.BLB [<ApplicationName>.BLB] (download reserved)

- <nomeApplicativo>.BIN [<ApplicationName>.BIN] (download reserved)
- <nomeApplicativo>.DEV [<ApplicationName>.DEV]
- <nomeApplicativo>.GRT [<ApplicationName>.GRT] (upload only, from which the.GRP file is extracted)
- <nomeApplicativo>.IUP [<ApplicationName>.IUP]
- <nomeApplicativo>.LCT [<ApplicationName>.LCT]
- <nomeApplicativo>.PVT [<ApplicationName>.PVT]
 <nomepRacklog>.BIN, <nomepRacklog>.CSV, <nomepRacklog_ GRAPH>.CSV [<pRacklogName>.BIN, <pRacklogName>.CSV,

characterises (contraction) contracterises (contracterises (contracteri

The files exchanged with the NAND memories of pRack controllers are:

- any file that the pRack can independently copy to the flash memory (see above list);
- external files (e.g..pdf or.doc files for documentation).

10.3 Pendrive: operating instructions

10.3.1 File extensions, names and contents

Various types of files can be uploaded and downloaded and are distinguished by their extension.

File names

In order to be recognised, the names of the directories and files on the pendrive must have no more than 8 characters; the controller makes no distinction between upper-case and lower-case characters. However, during DOWNLOAD the names of the directories created by the controller on the pendrive are always in upper-case.

FILE TYPES FOR UPLOAD

File extension	Description
.IUP	Contains the definitions of the screens on the terminal
.BLB	Contains the application
.BIN	Contains the application (with pLAN table)
.BLX	Contains the Logique of atoms custom in C language
.GRP	Contains the graphics
.DEV	Contains the preset configuration parameter values
PVT,.LCT	Contains the descriptions of the public variables to be
	logged. Generated by 1Tool, this is used by the LogEditor
	module and must be loaded together with the LCT file

Downloaded files are saved in directories created automatically, with the following name format: NAMXY_WZ

Where:

NAM: identifies the type of data downloaded (LOG for logs, BKP for the application, DEV for the buffer memory, CPY for all the data from the controller).

XY: progressive number from 0 to 99

WZ: controller pLAN address.

Example: a directory named LOG00_01 contains the log files (LOG) downloaded from a device whose pLAN address is 1. Since the key contained no directory of this type before download, it is indicated with 00.

Important: No more than 100 files of the same type can be downloaded to the pendrive, as the directories created can only be numbered with XY=00 to 99.

FILE TYPES FOR DOWNLOAD (controller pLAN address = 1)

File extension	Directory name	Description
.DWL	LOG00_01	Logged data
.DWL,.DEV,.LCT,.	BKP00_01	Application
PVT		
.DEV	DEV00_01	Non-volatile parameters
.DWL,.DEV,.LCT,.	CPY00_01	All data on the controller
PVT		
		Tab. 10.e

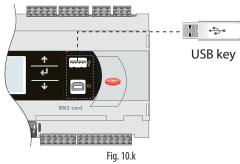

The downloaded files to have fixed names. In particular, the application file is called "ppl–pRack.dwl", the BIOS file "bios–pRack.bin", the files containing the logs and related information are "logs.dwl", "logs.lot" and "logs.pvt", respectively. Finally, the buffer memory is saved to the file on the pendrive.

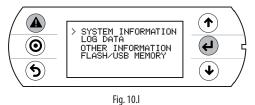

Menu access

The following are the steps for accessing the pendrive management menu. Procedure:

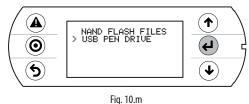

1. Connect the pendrive to the master port.

2. Press Alarm and Enter together for 3 seconds to enter the option menu. Select FLASH/USB memory and press Enter to confirm.

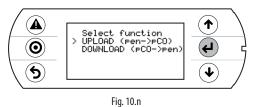

3. Select USB pen drive and press Enter to confirm.

Important: Wait a few seconds after the pendrive has been plugged in for it to be recognised by the controller. If the message "No USB disk or PC connected" is displayed momentarily with the request to connect a pendrive key or computer USB cable, wait a few seconds until the recognition message is shown ("USB disk found") and the following screen appears.

4. Select UPLOAD.

10.3.2 Upload

An application plus BIOS or buffer memory (parameters) can be uploaded from the pendrive. The following modes are available: automatic, autorun and manual. Automatic and autorun modes require using configuration files.

Configuration file structure

Configuration files must start with the string "[FUNCTION]" followed by a string that identifies the function, as shown in the table.

Function	String
UPLOAD an application or a BIOS file plus an	Upload application
application	
UPLOAD non-volatile memory (.dev)	Upload non volatile memory
UPLOAD the entire contents of the pRack	Copy pRack upload

After the description of the desired function, various options are available:To copy the complete contents of the directory, simply write the name of the directory (e.g. the entire contents of the CHILLER directory):

[FUNCTION] Upload non volatile memory	
[DIR] CHILLER	

2. To copy just 1 file in a directory, enter the file's name (e.g. the CHILLER.DEV file in the CHILLER directory).

[FUNCTION]	
Upload non volatile memory	
[DIR]	
CHILLER	
CHILLER.DEV	

To show a string on the display describing the operation being performed, add the "[NAM]" instruction, followed by the string to display. The following file will display the string:

"UPL CHILLER.DEV"
[FUNCTION]
Upload non volatile memory
[DIR] CHILLER
[NAM]
UPL CHILLER.DEV
CHILLER.DEV

3. To select only some of the files in the same directory, list them after a label. The following labels are allowed and **must be entered in the order shown in the table:**

UPLOAD file labels

No.	Label	File type	No.	Label	File type
1	[BIO] (*)	file.bin	6	[PVT]	file.pvt
2	[IUP]	file.iup	7	[LCT]	file.lct
3	[BIN]	file.bin, blb	8	[OED]	file.oed
4	[DEV]	file.dev	9	[SGN]	file.sgn
5	[GRP]	file.grp			

(*) BIO = BIOS file

- to get the.bin file from the BIOS in the format available on http://ksa. carel.com (.os file), unzip the.os file;
- the [IUP] label can be followed by one or more "iup" files.

- the order in which the file names are entered is fundamental and must not be changed;
- do not enter empty lines or spaces in the file (e.g. at the end of a line);
- each file after the last line of code must contain a "carriage return" character (CR,J), as shown in the following example.

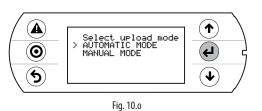

Example: The following file will upload the BIOS and an application.

[FUNCTION]	
Upload application₊J	
+J	
[DIR] ↓	
NEW AHU 🗸	
+J	
[NAM] →	
BIOS+APPL+LOGSv58B36 ₊J	
<u>جا</u>	
bisn509.bin ↓	
+J	
[IUP] 🗸	
AHU_EN.iup ↓	
AHU_IT.iup ₊J	
۲	
[BIN] , J	
AHU.blb 🖵	
+J	
[DEV] ,	
AHU.dev 🖵	
۲	
[GRP] ↓	
لہ AHU.grp	
۲	
[PVT] 🗸	
AHU.pvt ↓	
۲	
[LCT] 🖵	
AHU.lct 🚽	
L	-

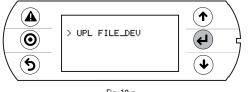

10.3.3 Automatic upload

To automatically upload the parameter memory using the first configuration file shown in the preceding paragraph, access the system menu as previously described and proceed as follows:

1. Select automatic mode. A screen is shown describing the function of the buttons. Press Enter to confirm.

 Confirm by selecting Prg. A screen is displayed requesting confirmation to upload the non-volatile memory. Press Enter to confirm.

3. At the end a message will ask the user to remove the pendrive.

ENG

10.3.4 Upload in autorun mode

Uploading in autorun mode is a special case of uploading in automatic mode. Unlike automatic mode, the user must wait for a specific message to appear on the display to start or disable the operation described in the configuration file. To upload a file in autorun mode, a configuration file must be created and named "autorun.txt". Example of uploading BIOS+application. The upload involves two steps: first the BIOS is updated and then the application. The information is shown on the pRack's built-in display and on the pGDE terminal, when both are featured.

Procedure:

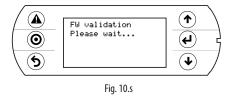

1. Connect the pendrive to port A.

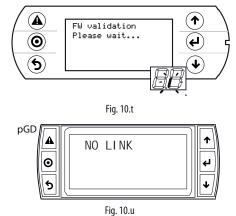

2. After a few seconds, Autorun mode starts. Press Enter to confirm.

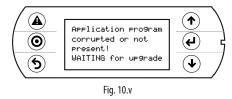

3. The validity of the FW is checked and the BIOS is loaded.

4. The display flashes to indicate that after loading the new BIOS the controller is being reset.

5. The test phase starts.

7.

pGD

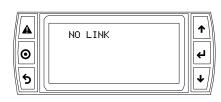

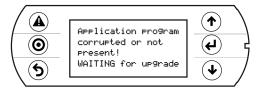

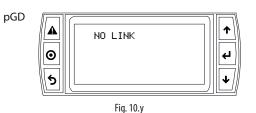

Fig. 10.w

6. The controller warns that no application has been loaded.

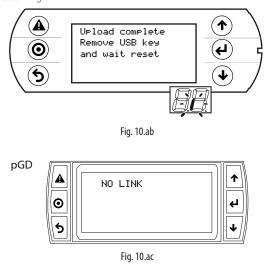

The application update then starts.

 Remove the pendrive. The update is complete. Wait for the display to stop flashing, indicating that the controller is being reset before restarting.

Important: As can be seen, when updating the BIOS and the application, the pGDE terminal shows the message "NO LINK", meaning that no connection is established. Do not remove the terminal and wait for the end of the update procedure, when the pGDE terminal replicates the messages on the built-in display.

Note: Autorun run is especially useful in those cases in which the same operation needs to be performed on several controllers. For example, to load different applications on controllers connected in a pLAN network, only one autorun file needs to be created; this uploads the various directories contained on the pendrive based on the address of the controllers. The controller with address XY will only load the directory called "nomedir_XY" ["DirName_XY"]. The pendrive then only needs to be plugged into each controller to run the upload, confirming from the shared terminal.

10.3.5 Manual upload

To manually upload the contents of the pendrive the user must access the management menu from the system screens, selecting UPLOAD and then MANUAL. The files are selected by pressing ENTER when the cursor is on the desired file name. A selected file is marked by the symbol "*" on the left. Once the files have been selected (all in the same directory), press PRG to start the upload. To display the contents of a directory press ENTER. To go up one directory level press ESC. Once the upload has started, the messages shown on the screen are the same as in automatic and autorun mode.

10.3.6 Download

As mentioned above, the DOWNLOAD operation can be managed in two ways:

- 1. Manual mode: follow the steps described in the paragraph "Automatic upload" and select manual operation. Then each file must be selected and downloaded.
- Autorun mode: prepare a file called "autorun.txt", containing a string that identifies the function to be performed.

Function	String
DOWNLOAD the application	Download application
DOWNLOAD non-volatile memory	Download non volatile memory (.dev)
DOWNLOAD the entire contents of	Copy pRack download
the pRack	

The result is the creation of files with the required extensions, which will be placed in the respective directories as described in the paragraph "File names". When the operation is completed, the display shows a message with the name of the directory created.

The following screen will be displayed.

1. Press Enter to confirm.

2. Download completed.

Fig. 10.ae

AREL

Connecting to a computer

Connect the slave USB port on the controller to the USB port on the computer where pRack Manager is installed.

USB connector from computer Fig. 10.af

Important:

• do not install any type of converter between the computer and port B, even if requested by the program's guided procedure;

- pRack Manager manages compressed files (.GRT/.OS).
- Once the connection is established, the following operations are available:
- 1. UPLOADING the application or BIOS+application. DOWNLOADING the non-volatile memory.
- 2. 3
- Commissioning
- 4. Managing the NAND flash memory.

Once the USB cable is removed, the port will become available again after approximately 5 s.

Important: If no connection is established with pRack Manager after plugging in the USB cable, wait at least 1 minute before using the USB ports again after removing the cable.

10.4 Configuring pCOWeb/pCOnet from a system screen

See par. 6.6 for information on how to access the BIOS system menu. Starting from:

- BIOS release 5.16 BIOS, and from
- pCOWeb firmware version A1.5.0, and from
- pCOnet firmware version A485_A1.2.1

pCOWeb and pCOnet communication parameters can be configured. The purpose is to configure the network (Ethernet for pCOWeb, RS485 for pCOnet) when the respective card is installed for the first time. The remaining parameters (alarms, events, etc.) can be configured using the usual tools, i.e. BACset or web interface (pCOWeb only). Configuration can be done either when using the Modbus protocol or the CAREL protocol, but only on the BMS1 serial port. The screens for configuring pCOWeb and pCOnet can be opened by accessing the system screens and selecting OTHER INFORMATION and then PCOWEB/NET Konfig. Then, select "PCOWEB settings" to configure pCOWeb parameters or "PCONET settings" to configure pCOnet parameters.

Configuring pCOWeb

When you select "PCOWEB settings" the following screen will appear:

D	Н	С	Ρ	:		-	-	-									
Ι	Ρ		А	D	D	R	E	S	S								
			-	-	-		-	-	-	-	-	-	-	-	-		

After a short time the fields are populated with the current parameters. If the fields are not populated with the current parameters, check the firmware version of pCOWeb and the protocol used by the BMS serial port. The parameters can now be edited by selecting the respective fields using the ENTER button and setting the desired values using the UP/DOWN buttons. If the DHCP option is set to ON, the IP address and Netmask fields cannot be changed. Pressing ENTER repeatedly will display all the parameters available, as listed in the following screens:

Ν	е	t	m	а	s	k	:										
		-	-	-		-	-	-	•	-	-	-	-	-	-		
G	а	t	е	w	а	У	:										
		-	-	-		-	-	-		-	-	-	-	-	-		
	N.I.	0															

		0		•												
		-	-	-		-	-	-	-	-	-	-	-	-		
D	Ν	S	1	:												
		-	-	-		-	-	-	-	-	-	-	-	-		
D	Δ	C	n	-	+		1									

В	А	С	n	е	t	Ι	D	:								
							-	-	-	-	-	-	-			
В	А	С	n	е	t	Т	У	р	е	:						
							-	-	-	-	-	-	-			

Once the parameters have been chosen they can be updated by going to the following screen and pressing ENTER.

Ρ	С	0	W	Е	В	С	0	Ν	F	I	G		Е	Ν	А	В	L	Е	
U	р	d	а	t	е	р	С	0	W	е	b	?		Ν	0				

While the parameters are being updated, the following message is displayed:

Ρ	С	0	W	Е	В	С	0	Ν	F	Ι	G		Е	Ν	А	В	L	E	
Ρ	Ι	е	а	S	е	W	а	i	t		f	0	r						
е	n	d		0	f	u	р	d	а	t	е								

At the end, the screen shows:

Ρ	С	0	W	Е	В		С	0	Ν	F	Ι	G		Е	Ν	А	В	L	Е	
U	р	d	а	t	е		С	0	m	р	Ι	е	t	е						
R	е	b	0	0	t		р	С	0	W	е	b		t	0					
а	р	р	I	У		n	е	w		s	е	t	t	i	n	g				

Configuring pCOnet

When you select "PCONET settings" the following screen will appear:

В	А	С	n	е	t		Ι	D	:								
								-	-	-	-	-	-	-			
В	А	С	n	е	t		b	а	u	d	:						
						-	-	-	-	-	-	-	-				

After a short time the fields are populated with the current parameters. The parameters can now be edited by selecting the respective fields using the ENTER button and setting the desired values using the UP/ DOWN buttons. Pressing ENTER repeatedly will display all the parameters available, as listed in the following screen:

В	А	С	n	е	t		Μ	А	С	:		-	-	-				
М	а	х		Μ	а	S	t	е	r	s	:		-	-	-			
Μ	а	х		F	r	а	m	е	s	:		-	-	-	-	-		

Once the parameters have been chosen they can be updated following the procedure described for configuring pCOWeb.

11. APPENDIX

A.1 System configurations with more than one pLAN board

If the system configuration involves the connection of more than one board in a pLAN, the addresses must be set correctly before selecting a configuration solution. pRack pR300T can use two user terminals (as well as a built-in terminal) with addresses 31 and 32. The default user terminal address is 32, so only if a second terminal is required must the address of this be set to 31, as described below. The address of the terminal is also required when having to set the address of the pRack pR300T boards, when multiple boards are connected to the pLAN. After having correctly connected and configured the pLAN network of pRack pR300T boards, the system can be configured as described in paragraph 4.1.

A.1.1 Setting the terminal address

IThe pRack pR300T user terminal is supplied with the default address 32, allowing the terminal to be used without requiring any additional operations; nonetheless, in order to use an additional terminal or configure the pLAN address of the boards, it needs to be changed according to the following procedure:

- 1. power the terminal via the telephone connector;
- 2. press the three buttons ↑, ↓ & ↓ together for at least 5 seconds; the terminal will display a screen similar to the one below, with the cursor flashing in the top left corner:

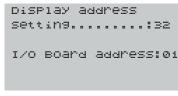

Fig. A.a

press ←once: the cursor will move to the "Display address setting" field;
 select the desired value using ↑ & ↓, and confirm by pressing ← again; if the value selected is different from the value saved, the following screen will be displayed and the new value will be saved to the display's permanent memory.

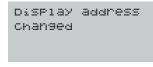

Fig. A.b
Fig. A.b
Note: if the address field is set to 0, the "I/O Board address" field is no

longer displayed, as it has no meaning.

- if the settings are not made correctly, the text and the images on the display will be displayed incorrectly and out of order.
- if during this operation the terminal detects inactivity of the pRack board whose output is being displayed, the display is cleared and a message similar to the one below is shown.

If the terminal detects inactivity of the entire pLAN network, that is, it does not receive any messages from the network for 10 seconds consecutively, it clears the display and shows the following message:

A.1.2 Setting the pRack pR300T board address

The pLAN address of the pRack boards can be set from any pGD1 terminal, using the following procedure:

- 1. set address 0 on the terminal (see the previous paragraph for details on how to set this address);
- 2. power down the pRack pR300T board;
- disconnect any pLAN connections to other boards from the pRack pR300T board;
- 4. connect the terminal to the pRack pR300T board;
- power up the pRack pR300T board, while pressing ↑ & ▲ on the terminal together. After a few seconds the pRack pR300T board begins the start-up sequence and the display shows a screen similar to the one below:

Fig. A.e

- 6. when this screen is displayed, wait 10 seconds and then release the buttons;
- 7. the pRack pR300T board interrupts the start-up sequence and shows a configuration screen, similar to the one below :

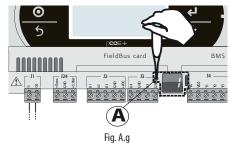

PLAN address: Ø UP: increase DOWN: decrease ENTER: Save & exit

Fig. A.f

Then, modify the pLAN address using the ↑ & ↓ buttons on the terminal.
8. Confirm the address by pressing ↓: the pRack pR300T board completes the start-up sequence and uses the set address.

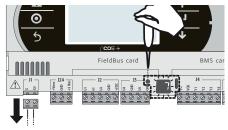

1. Displaying the pLAN address

 press briefly (no more than 5 seconds) button A to display the current controller pLAN address. The display is cleared 5 seconds after releasing the button.

Setting the pLAN address

- 1. press button A for 5 seconds. The pLAN address will start flashing;
- 2. press repeatedly or press and hold the button until reaching the desired address (e.g. 7); remove the screwdriver;
- wait until the address starts flashing quickly. The address is now saved but not yet active for the application program;
- 4. power down the controller;
- 5. power up the controller again. The address will now be activated.
